The most important request, for those of us using Mapfix in the UK, is to include the code which you have in APRS to display the cursor position in Ordnance Survey National Grid Reference (NGR) as well as Lat/Lon. Most detailed maps of the UK use the NGR system and at present it's impossible to check that point positions are correct within Mapfix. Could this be added to a future version of Mapfix and, when the cursor is within the UK, display the NGR at top left of screen below the Lat/Lon?

Thanks,
Mike Tyrrell   G6GAK

WB4APR REPLY: I dont know how I can make it any clearer to you! APRS only uses COM1 and COM2 because that is the only ones PERMITTED BY MICROSOFT when the wrote the QUICK BASIC COMPILER... IF I could, I would. Stop complaining, or write it yourself!

An advertisement would indicate that the sender had received compensation for its publication/broadcast, however I'd think that considering how much some of us have been paying to services like AOL, Compuserve, etc., personally I'm always glad to know of any opportunity to save money. Last month my Compuserve bill was $165.00! I recently changed my Internet service to another service that now only costs me $29.00/month, unlimited access.

While I don't think the AT&T deal is such a great deal when you consider how many hours the average Internet user expends, but there you go....

WB4APR REPLY COMMENT: GOod point! Ill fix it. In the mean time, you can delete all of the very big GetUSGS subroutine near the end of MAPFIX and get LOTS of room. THis routine also has an internal label Skp:, which should also be deleted all the way down to the RETURN. Then it will easily run under QBasic. ALso you may have to mess around with your buttons too. Look in the begininng of the MAIN: routine for where I think I do

```
something with the buttons returned from my GETxy routine...

USGS CD ROMS are useless in the UK, so you wont need this routine.  It is
obsolete anyway, since KE4KXE's program MAKEMAP1.exe does it all in one step!

Rendered body type: text/plain

```
I admit it, I'm a bit dense at times! I've watched the threads on
the U2000 and APRS and I still haven't figured out how to get my U2000 to
send WX data in a form that will show on any flavor of APRS. Let me describe
what I've done and then you guy's tell me where it is my ignorance pop's in.
        I'm using a Pico Packet 2 serial port TNC and an Ultimeter 2000, I
bring the 2000's serial data into port 2 of the tnc, the 2000 is in data
```

```
logger mode and outputs a string that starts with !!. I set the pico's
gpstext variable to !! and I set the lpath variable to aprs v relay,wide I
set the btext to/******/4145.92N/9142.42W/NM0B Cedar Rapids IA. I finally
set the variable loc to every 6 and the variable becon to every 6, and then
set the variable gps to on.
        Now according to my limited thought process this should work. I've
set my other tnc to monitor all packet's and run my packet terminal software
to verify both btext and ltext are being sent.
        When I switch to APRS the btext is seen by APRS but the ltext isn't.
So were am I screwed up? I'm sure I've missed something very simple and will
kick myself when I become enlightened by all. Thank's in advance!

>APRS--Kansas City Coordinator
>EMail: ku0g@sprynet.com

>"I'll be glad when schools have all the money they need
>and the Air Force has to hold a bake sale to buy a bomber!"

First of all, the person who asked what any of this internet
 access has
to do with APRS: it is how we get to the APRS sig
 if we don't have an
employer who lets us use his internet
 connection, then we have to pay for
it. An inexpensive hint
from a sig member seems very appropriate to me.

Advertising: get real. For once, somebody provided most of the
 needed
info to even decide if it was worth a call. What does
 he get for his
consideration: walks like a duck observations
 from the peanut gallery.
Obviously someone has too much time on
 his/her hands.

The offer: if you still have to make a LD call to get to the point
 of
entry (and you may, because AT&T says they only have 200 points
throughout the country), then their offer is nice if you happen
 to be in
the locale of one of the points, otherwise, it is just
 like any other
ISV. I sent for the free software, because it could
 be fun to play with,
esp since it comes on CD if you like and the
 only platforms supported are
Win 3.1 and Win95.

Five free hours of internet time is not such a good deal when
 20 cents
per minute = $12.00 per hour. The internet time is free,
 but it will cost
you 60 bucks (which just happens to go to AT&T)
 in LD service to take
advantage of it. It's a nice marketing ploy,
 however, and may be a
genuinely good deal if you happen to be
 within a local call of the "point
of entry".

Does Qbasic or does it not permit calls to assembly or C routines
 that
could, in fact deal with the problem? It is perfectly fine
 if you don't
want to do it, but to say it CAN'T be done, is a
 different matter
entirely. If it is true, that Qbasic programs
 cannot call to assembler or
C routines, then I have been mistaken
 from the beginning with respect to
APRS, but the general point about
 amateur software authors remains
valid.

As far as complaining, I never assumed that asking an author to
 improve a
program that I bought from them was complaining.

Thanks for setting me straight.

34. APRS in the UK

From: Mike Tyrrell <100321.1327@compuserve.com>
Date: 02 Mar 96 16:31:38 EST
To: "'APRSSIG'" <aprssig@tapr.org>
Message-ID: <960302213137_100321.1327_JHF49-3@CompuServe.COM>
Rendered body type: text/plain

Thought I'd let the SIG know about recent APRS activity in the North West of England.

Over the past few months our local RAYNET (Radio Amateurs Emergency Network) group in Cheshire developed an APRS network suitable for use during emergency situations. About 10 RAYNET members are now trained to use the software and a number of other amatuers in the area have also become interested. Equipment has been built and tested to allow a wide area node to be sited on suitable high ground at short notice (we don't yet have any permanent wide area digipeaters or agreed APRS frequency). Two GPS tracking units are in use based on Garmin 45 & KPC-3, one of these is vehicle mobile and the other can be carried in a backpack.

In February the whole system was used live during the Frostbite '96 event. This involves around 200 runners competing over cross country paths in Cheshire, covering around 50 miles in two days. RAYNET provide communications for event safety and produce the results. This is our largest annual event and involves more than 25 radio amateurs.

Although we had used packet radio in previous years to help with the results we always found it too complicated to distribute minute by minute information such as where people are on the course.

The APRS system was a fantastic success and worked all weekend without any problems. In the event control room two APRS displays were used, one ran the DR4 version and transmitted estimated positions of lead and tail runners. The other was used as a "read only" slave unit and enabled the event controller to see positions on the map and read bulletins from the checkpoint stations. We even got to use some unexpected symbols on the map - the fire and fire-truck!

The GPS units were used on the drinking water van and the "sweep" team who walked the course behind the last runners to locate any injured competitors.

A full description of the event complete with pictures, maps, screen shots and

HST files which can be downloded and replayed can be found at my home page :-

http://ourworld.compuserve.com/homepages/Mike_J_Tyrrell

Cheers,
Mike   G6GAK

P.S. If you have any UK APRS maps I'd be happy to put them on my page for others
to download.

Start a thome page:
http://www.tapr.org/
then click "Special Interest Groups" which moves you to:
http://www.tapr.org/tapr/html/sigs.html
then click  FTP which moves you to:
ftp://ftp.tapr.org/tapr/SIG/aprssig/
then click on uploads and you are there.

No big deal, from Netscap or FETCH  I just use:

ftp://ftp.tapr.org/tapr/SIG/aprssig/upload/

I don't see how one can miss it.

I was playing today on 30 meters and trying to talk to n7vlr in Mexico.
I had to digi off of w7lus.  Here was my path:
via w7lus,gate,wide/aprs via kd4emi-3,wide,wide

OK  I know about the warning on digi on HF  but I was getting
```

```
the VHF to HF gate warning..
(YOU HAVE GATE IN YOUR VHF PATH   etc etc)

Well  I aint got gate in my vhf path...HF path is first right !

When I changed my path to
via gate,wide/aprs via kd4emi-3,wide

I didnt get the warning.
The warning I used to get was
IS it nessesary to digi on HF  this cuts capactiy  blah, blah

Of course Im running a KAM  and the CB is 2H  (HF 2 port)
Weird huh ?
#2
I am going out to look at my GPS.  Since Ive not seen anything on the
sig yet similar to New years celebration  Im going to guess that SA
is NOT off.   Anyone else notice anything ?
Mike  KD4EMI

OK, so most people are agreed that we need to have an external call to configure
the ComPorts.  Why don't one of you programmers out there work WITH Bob to
develop the appropriate assembly language routine that APRS could call up?
Seems like the thing to do to me....Wish I knew how to do it myself!!!

Forget WIDE,anything  TheNet only accepts ONE ALIAS in it's unproto path.  So the
best you can hope for is WIDE.  Also, since the string is sent out as ID via WIDE
you need to put !APRS as the first thing in your BTEXT.

>

Al I hope this helps.  I have sent a request to the author of X8J to allow more than
one alias in the VIA/unproto string.  Hopefully we will see this in the next
release.

    The server at LSSU came back on line after a good 24 hr crash, and it
would seem that I missed some sparks?

    As one who lives in a backwater of the rural US, and lives in a county
of 1300 square miles, served by party lines, the possibility of access to
the Internet without long distance rates was a joyful discovery. In my
childish enthusiasm I thought the information may be of value to others
that have no local point of presence for internet access. To those cynical,
myopic, misanthropic SIG, members that took offense to my childish zeal,
my apology. To those who may know of others that would join this SIG or
would find the cost of participation more appealing with possible local
access, let
them know.

    Have I made the grade Bill? Can I sit along side of you?  :-)

                                     Pete, wa4hei

> schiers@ibm.net
> ---Dear Hasan,

Windows 3.1 supports 9 com ports and a bus mouse nicely. Whats worse than com port stupidity is hardware assholeyness. Every peice demands an IRQ, usually in the old xt range - which means 3,4,5,7. Kiss running most things together. Most demand an I/o address in the 300 to 360 range. Then the drivers all demand conventional memory, but the author snivels and says you can move his 100k + driver "high" to share with the other stuff that can be moved high when with even half assed design virtually all can be moved into either extended or expanded memory and avoid this stuff.

Of course, if most external hardware moved into the 90's, it would not use a serial port. With ethernet cards retailing at shows in the 24 dollar range, and the hardware cost to install the interface not much more than for a serial port, I wonder when hams will come into the 20th century. Think of it, hundreds of devices using Win 95 built in comm software, talking over 1 bus, with no software or hardware conflicts, etc. Boggles the mind, but since it has only been happening in business LAN's for only 10 years, it will take at least 30 more before the technology is ancient enuff for hams.

```
        Oh well, what I really wrote for was to support you and your
demands that hardware and software people get real.

                                        Lots of Good Luck
```

You know what they say about opinions, don't you?  Just like certain body parts,
everybody has one!  Personally, I kind of enjoy some of the debate that comes up
on the sig even though it's not always APRS-related!  I say:  SO WHAT!

As for my signatory addendum:  I am NOT anti-military and the statement (which
follows herein) is merely intended to draw attention to the plight of school
funding.  I copied it from a bumper sticker that I saw last week!  I thought it
most appropriate, given my current employment status as a teacher!  I suppose
that it could have said welfare, social security or any other government-funded
entity and would still draw fire from somebody!  If it THAT offensive then I
will certainly remove it.

I could, at this point, go into a non-APRS rhetoric about the current state of
educational funding in Missouri and what our peculiar legislature has done every
year for the past 10 years, but I won't.

Hi John and tnx for the reply...
(Just a note, that your ALIAS on your Email comes up as N4QEA and not
N5QEA... thought I'd let you know.)

Anyway, tnx for the help on the X1J-4 info.  I went through the X1J-4
program and saw exactly what you said; No hope for a WIDE,WIDE.  But can
the identification address be changed "remotely" from ID to APRS?
Our present BTEXT is set as follows:
KD3GG-13>ID !4122.30N/07535.50W#PHG3693/LACKAWANNA CO. WIDE-RELAY
Are you saying that when I get into its brain, I should type:
BTEXT !APRS (IN FRONT OF THE OTHER STUFF? WITH OR WITHOUT A SPACE? WITH
OR WITHOUT ANOTHER !)  I'LL GIVE A FEW OF THEM A TRY.

Please let me know exact entries ans again tnx for helping.

Would you guys QUIT complaining and let us non-programmers know exactly HOW
to get Win95 to live happily with lotsa COM ports? And get off the "LAN is
better than Macs are better than PC's" thing. Unless I'm mistaken, we're on
this because of APRS, and my understanding is that APRS is for things that
Bob APR intended it to be for, REGARDLESS OF WHAT THE SUBS THINK THE BEST
PLATFORM IS!!!

Or is this SIG just for "smart" guys? Kinda looks that way.

        I have been running my standalone (garmin-45 and kpc-3) on the dash
where i can see the garmin 'front page' to watch coverage. every so often i
put my reading glasses on so i can see what the reported error is and it
seems to be a lot lower than i remember in the past. it runs down to 57
feet and very seldom gets over 300 feet unless i have only 2 decent
satelites. the norm seems to be in the 100-200 foot range.

        maybe it's time to park it in the yard running and watch it move
around from the house....

        never the less, i like the smaller errors!!!

56. APRS satellite link?

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 3 Mar 1996 16:40:11 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960303162855.20142D-100000@greatlakes>
Rendered body type: text/plain

It looks as if those of you with PSK satellite modems are invited to
digipeate via the WO-18 satellite. Here is the quote from the AMSAT news
service:

Well, I lost the file... But they said that it is in DIGIPEATER mode.
Uplink on 145.900 PSK using AX.25 via WEBER-1. Downllink in the 437 MHz
band (PSK).

Although 99% of us cant play, it only takes one person per area to get
these packets through! Remember, that the links on these microsats only

require omni directional antennas and modest power. The only thing
unusual is having a PSK satellite modem and SSB radio.

Does a subgroup of APRS'ers wanna play?

57. Re: [APRSSIG:7198] Re: I need more COM Ports!

From: schiers@ibm.net (Robert Schiers)
Date: Sun, 03 Mar 96 22:05:32
To: aprssig@tapr.org
Message-ID: <199603032239.WAA101686@smtp-gw01.ny.us.ibm.net>
Rendered body type: text/plain

In <313997E5.56E7@cyberg8t.com>, on 03/03/96 at 07:13 AM,
   Robert James Harris <bob@cyberg8t.com> said:

>   Windows 3.1 supports 9 com ports and a bus mouse nicely. Whats
>worse than com port stupidity is hardware assholeyness.

I want to distance myself from characterizations like "stupidity"
 and
"assholeyness". While I obviously agree with your assessment
 of the
problem, I am concerned about the timbre of the discussion.
 I had no idea
when I tried to describe the nature of the limitations
 of the program
that so many people would become emotional both pro
 and con.

I am not interested in pursuing an emotional debate about such a
 trivial
issue. The program is great. It could do some things better
 for my needs.
My objective was not to stir people up on either side
 of the issue, but
to get ham software authors to consider the
 environment that their
software was going to run in, and REQUEST
 that they take advantage of the
machines and operating systems
 and tricks therewith, so we, the USERS
could get maximal benefit
 from our software and hardware investment.

I have absolutely nothing critical to say about Bob. I never have.
 My
intention was never to annoy anyone, but to make sure we had a
 complete
understanding of the problem and issue, i.e., we know it
 isn't a hardware
or architecture issue, is it a programming issue
 that can be overcome?
The answer appears to be yes, it is a
 programming issue which can be

overcome with assembler hooks to
 Qbasic. However, in attempting to
understand and explore the nature
 of the programming problem, I see that
nothing good was accomplished.

I would ask anyone who feels like responding pro or con to my series of
postings about addresses and interrupts to just let it go. It is
 wasting
bandwidth and bringing out the worst in people...something
 I have no
interest in doing.

```
>       Oh well, what I really wrote for was to support you and your  demands
>that hardware and software people get real.                         ^^^^^^^
>                                           Lots of Good Luck
```

I have demanded nothing of anyone. I have asked, requested, begged,
cajoled, whined and snivelled, (I don't think I had progressed to
"badgered" yet,but Bob's perspective may be different), and am
 perfectly
accepting of an answer of "I ain't interested in doing that."
 That is
what Bob ultimately said, and when he said that, I tried to
 drop the
thread. When I saw further postings which stated that what I
 wanted
"couldn't be done", which is patently false, I responded about
 the hooks
from Qbasic to assembler. And on and on...let's let this
 bugger die. It
is going nowhere and serves no useful purpose.

Message-ID: <199603032256.OAA04470@sprynet.com>
Rendered body type: text/plain

Well, that's big o' them, isn't it! We can digipeat but only a very few of us
due to equipment constraints! Still, it IS a step in the right direction!
Maybe we can still fly a mini-satellite of our very own from the Shuttle at some
point! It would still be nice if we could get permission to use the other
amateur satellites for this use!

OK, I'm jealous, I admit it. Wish I had the $$$ to go buy the PSK and SSB rigs
to do this! In the meantime, if anybody else can do this, I strongly encourage
them to take advantage of this opportunity!

There is such a difference between the general kindness that hams give thru
their mikes, and the rudeness that some send to APRSSIG. May I suggest that
after flaming, rather than send it to `out queue', send it to `trash'. I've
enjoyed some of the opinions as much as which Com port, and after a smile,
or frown, there is always the delete key. Email isn't an excuse to forget
one's manners.

Message-ID: <Pine.SUN.3.91.960303220548.20620C-100000@greatlakes>
Rendered body type: text/plain

I havent received any recent reports of new WIDE digis. Please LOAD or REPLAY the files DIGISe.bk or DIGISw.bk and be sure that your area WIDES are shown. Also REPLAY the TORCHw.bk, c.bk (e is not finished yet)

If not, send me an extract of your P-LIST with the missing digis. Nothing else, no ego-peaters, just good PERMANENT wide area digipeaters. I want the DIGISe and DIGISw files to be current for travelers...

This will be important as we get closer to OLYMPICS TORCH time...

By the way, my TORCH is finished. Looks nice. Uses a MIM, Agrelo XMTR and GPS-20 card. It is all PVC pipe about 18 inches total height.

```

66. 300 packets senario w/MIM contest.

From: JAgrelo@aol.com
Date: Mon, 4 Mar 1996 11:14:00 -0500
To: aprssig@tapr.org
Message-ID: <960304111359_159703673@mail04.mail.aol.com>
Rendered body type: text/plain

```
TO THE SIG,

Ok, here is a BIG question with a FREE prize.

We have been approached by a University to produce 300 HPVFC/MIM units that
transmit a ID and A,B,C or D answer corosponding to a button press. These are
students transmitting answer packets for a lecture survey to be received by a
scanner for software retrieval and ultimatly printout for data calculations.

The BIG question, how can you cost effectivly, with out data collision
receive three hundred packets at once? Keep in mind that each student needs
time to think about their answer before they depress a button. Having 300
custom made crystals would be very expensive. And transmitting at 300
different time delays would take too long i.e 5 minutes total if they were
all at different incrementing 2 second delays 60 packets per minute, they
would all have to transmit exactly at the same time to get the timming right
and the receiver would have to scan very fast with each consecutive delay
```

consecutively in the scanners memory. The transmitters would be 10mW RF for
those about to FLAME me.

Please, only reply if you have a good solution or answer.

The winner gets a FREE HPVFC transmitter for a practical, working, ideal
solution.

GOOD LUCK!

I would suggest using 5 or 10 channels to start as this would greatly relieve the collision problems. A multiplex receiver is the next item of business.

Another suggestion would be to have the MIM unit hold all of its data until polled by the base unit! That way the base unit has full control of the system and can then effectively control the potential collisions before they occur.

Some sort of master control program (boy this is starting to sound like TRON!) could configure the system to the actual unit ID's, number of units active during the session, etc., etc.

Another obvious solution would be to simply have the MIM's hold ALL data for the testing session until the testee has completed the exam. The user then would push a FINISHED button to transmit his/her responses to the master control unit. This would probably limit the number of questions that could be given at any one sitting, or then the user may have to be prompted to "TURN THE PAGE/PUSH PAGE DONE BUTTON NOW"....

Going back and reading the original posting and reading about the Lecture Survey really negates some of the latter paragraphs above. I think a multi-channel system may the best answer at this point, but I WILL keep thinking about this problem!

Still won't work because the students are transmitting at different
intervals.

>Another suggestion would be to have the MIM unit hold all of its data until

For some unknown reason they must have the data as the questions occur.

> This would probably limit the number of questions that could be given at
any
>one sitting, or then the user may have to be prompted to "TURN THE PAGE/PUSH

>PAGE DONE BUTTON NOW"....

They want the student to concentrate on the question, not how to use the
answer device.
It has to be KISS.

Rendered body type: text/plain

Press Release. Please distribute as widely as possible. http://www.tapr.org
March 1st, 1996

ARRL and TAPR Digital Communications Conference
September 20-22, 1996
Seattle, WA, U.S.A.

1996 ARRL and TAPR Digital Communications Conference

Mark your calendar and start making plans to attend the year's premier event in amateur radio digital communications --

The 1996 ARRL and TAPR Digital Communications Conference will be held September 20-22, 1996, in Seattle, Washington -- just minutes from the SeaTac Airport. Local sponsors include the Puget Sound Amateur Radio TCP/IP Group and Boeing Employees Amateur Radio Society (BEARS).

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs and experts in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. This year marks the first year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting have joined into one conference!

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. Papers are due by July 23, 1996, and should be submitted to Maty Weinberg, ARRL, 225 Main St., Newington, CT 06111 U.S.A. or via Internet at lweinberg@arrl.org. Please contact Maty for detailed format requirements. Papers are due by July 23, 1996

ARRL and TAPR especially welcome papers from full time students to compete for the first annual student papers award. Two $500 travel awards will be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see guidelines for more information). Papers coauthored by educators or telecommunications professionals are also eligible for this award, as long as a student is the first author. First year awards have been funded through a grant by The ARRL Foundation, Inc. Deadline for receipt of finished student paper manuscript: June 11, 1996. Please note that this deadline is different than the general conference submission date. For full details and paper guidelines, contact TAPR or check http://www.tapr.org.

The current schedule has a workshop and student papers on Friday afternoon. Conference Papers, Introductory thread, Lunch, and Dinner on Saturday. Sunday will have additional paper sessions, if necessary, as well as one or more workshops. Workshops will include Keith Sproul, WU2Z, on APRS packet-location software, Dewayne Hendricks, WA8DZP , on "How to utilize Part 15 Radios for Ham Applications" and a workshop on Wireless Networking using WA4DSY 56K RF modem technology and its accessories. See the advanced registration form for more details as well as http://www.tapr.org

For more information on the Conference, registration, and hotel reservations please contact TAPR at the address below.

Hi Scott and tnx for replying...

Well I may very well have my terminology all screwed up.  In addressing
KD3GG-13 as a WIDE-RELAY, I intended to state that it has those two as
ALIASES plus its callsign.  I thought I was correct in stating it that
way... my apologies.

Please tell me the exact methodology in entering the BTEXT info as per
our last email.

Tnx agn es 73

Al, N3KAE

72. Re: 300 MIMs (fwd)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 4 Mar 1996 23:14:45 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960304230803.823A-100000@greatlakes>
Rendered body type: text/plain

```
Here is the proposal I suggested for 300 hand held "VOTERS" to transmit
their multiple choice response to the Professor:

1) Use a modified MIM to output a very short packet (.25 secs) with a
random start delay and a decaying period like APRS.  The initial period
is nominally X seconds. (Maybe 10)

2) It continues transmitting for N seconds. (Maybe 60)
* * * CUSTOMER must specify the minimum time between Questions! * * *

3) For each packet, for a 85% success rate, there can be no more than
   about .2 * X /.25 or only 8 per 10 second period.  But we have N / X
   such periods.  Using two such periods gives us a 97% chance of success.
   So, the channel capacity is about .5 * [ N / X ] * .18 * X / .25
   If N is 60, then the capacity is 20 units per channel
   If N is 120, then the capacity is 40 units per channel

3) You use F frequencies and have F Receivers and F TNC's.  For the case of
   N=120, then you will need 7 frequencies.  Quite managable...

************************************************************************
The importance of knowing N is paramount.  The customer must make that
specification, and he must live with it, or be willing to re-program all
the MIM's each time he changes his mind.  (That function would be field
programmable)
************************************************************************

This suggestion is a 1st order guess, based on ALOHA channel capacities.
It can be modeled and refined.  We would need to write a program and run
a simulation before we committed to the 97% success rate.  For a 99.7%
rate you would reduce the number of units per channel by 33%.

I wrote a simulation program that validates these results.

de WB4APR.

74. Problem with hearing my Digis

From: Richard Amirault <amirault@laraby.tiac.net>
Date: Mon, 4 Mar 1996 21:38:48 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.BSF.3.91.960304211701.1545B-100000@laraby.tiac.net>
Rendered body type: text/plain

```
I've seen other folks mention this on occasion on this sig, but it
happend to me *again* today and its time for me to mention it.

I run two 24hr APRS stations. One is a VHF stn at my home. The other is a
WX station at my job location. Until recently I was running 6.8a since I
kept getting problems with newer versions. 6.8a worked for me.

I recently upgraded the motherboard in my home computer (from a 386DX-40
to a 5x86-133) During the upgrade process I discovered that I had a bad
Simm memory chip somewhere. (I had been having problems with the machine
for a while)  It occured to me that maybe this might also have hindered my
APRS upgrade attempts. I replaced the bad memory. I downloaded 7.5 and
tried it. Everything worked just fine!

I took 7.5 into work and installed it on my 286 dedicated to my WX
station. It ran fine .... until I had to move my office (and my station)
from one side of the building to the other....

I was seeing my WX station all weekend from home, but when I got to work
this morning I noticed that I kept getting the msg that APRS was NOT
seeing the last digi.  I checked the TNC (the red xmit LED came on ...
and I saw the receive LED come on just after)  I checked the transmitter
(on proper freg, at high power, antenna connected, etc)  I *shut* the TNC
off, then powered it up again. I changed my Unproto path a half a dozen
times. I did *manual* transmissions with the 'X' key. I shut down APRS
and re-booted a couple of times.

Nothing worked ... *every* time I got the Digi Not Seen msg.

Then without toching any of the hardware ... I shut down 7.5 and booted
6.8a .... It worked just fine now!

I'm not saying that this is a problem only with 7.5 because I had the
same thing happen to me on 6.8a when I tried running my 8088 laptop
"live" mobile once.... (could NOT see any digis, but the recieve LED lit
up *every time* right after the transmit LED)

Any comments?

Anyone got a recommendation on the 'cheapest' way to set up stand-alone
trackers? it seems that using 'standard appliances', i'm going to have a
$550 investment for each tracker and $250 for each digi.

since you guys seem to be setting these things up all the time, how do you
manage without getting a bank to sponsor you?

APRS @ ALLUS                                       Filed: 032300GMT MAR 96
    Several messages concerning HF freqs for APRS have been seen on the sig
here and on Packet BBS's..
    Here are some suggestions by George/W8FWF and in Readme files, over a year
old:
-------------------------------------------------------------------------------
APRS HF FREQUENCIES OPERATIONS                        JAN 95
--------------------------------
HF FREQS: MFJ/KAM   AEA'S   Mode   NORMAL USAGE
          10.151    10.1515 LSB    Mostly East Coast so far (Calif late eves)
           7.085     7.0855 Lsb    Mostly West Coast. (Ocassionaly now )
          14.0963   14.0958 USB    Proposed new APRS DX Freq.

HERE ARE SOME OF THE APRS FREQUENCIES NOW IN USE ON THE LOW BANDS....
THE ENTRIES WITH (P) ARE NEWLY PRO0POSED FREQUENCIES STILL BEING TESTED..(By
who?)
--------------------------------------------------------------------------------
ACTUAL XMIT FREQ.    MFJ/KAM DIAL (1700HZ TONE)      AEA DIAL (2210HZ TONE)
--------------------------------------------------------------------------------
  3583.3 KHZ (P)      3,585   KHZ (LSB)                3585.51 KHZ (LSB)
  7083.3 KHZ          7,085   KHZ (LSB)                7085.51 KHZ (LSB)
10,149.3 KHZ         10,151   KHZ (LSB)             10,151.51 KHZ (LSB)
14,098   KHZ         14,096.3 KHZ (USB)             14,095.79 KHZ (USB)
18,098   KHZ (P)     18,096.3 KHZ (USB)             18,095.79 KHZ (USB)
21,098   KHZ (P)     21,006.3 KHZ (USB)             21,095.79 KHZ (USB)
24,928   KHZ (P)     24,926.3 KHZ (USB)             24,925.79 KHZ (USB)
28,098   KHZ (P)     28,096.3 KHZ (USB)             28,095.79 KHZ (USB)

  (Note: the 24Meg freq may be in error, someone correct me if so)
===========================================================================
The low bands will provide more activity and longer distances to the other
station. While a VHF TNC works at 1200 bauds, on the Low Bands, you will need
a TNC that will operate at a 300 baud rate. Several are available. Ideally,
you should opt for a TNC that will allow for simultaneous operation (GATEWAY)
on the low ands and also the VHF band. This allows you to link (GATE) the HF
data from the HF band, down to the VHF side. To see the newmerous HF out of
state APRS stations on your local VHF network band. (VHF 145.79/14501 & few
others.)
   Please read the HF.TXT file in the programs README.DIR. This will enlighten
many on the HF to VHF only use of GATEWAY stations and GATE paths.
   QSO among yourselves on testing the SUGGESTED frequencies, let the rest of
us know. Am willing to help, need date,time (GMT) and freq and will give it a
go OM..
    73's & Enjoy, Bill/WB6LPG SanFran Bay Area 30M reliable GATEWAY station,
on daily.. See Feb issue P45 of Cruising World for APRS for Yachting Hams.
Off mexico more S/V appearing, QSO and encourage the Yachting World about APRS.
NNNN

WBB/WB6LPG

WB4APR REPLY COMMENT: I *may* be making a bulk purchase of the GARMIN GPS-20 OEM board and connectors. I should be able to pass them out for $159 if I am lucky. Add an old $20 HT-220 motorola walkie talkie and $20 worthof XTALS, and a TNC for $130 and it adds up to about $350....
Or probably $400 if you buy off the shelf radios...

Dont send me mail about the Garmin boards until I know If I am going to go out on this limb..... You will hear about it here...

80. APRS Packet Simulation Program

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 5 Mar 1996 16:55:33 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960305164954.9525A-100000@greatlakes>
Rendered body type: text/plain

In response to the Agrelo problem of having 300 hand held APRS MIM transmitters for transmitting 5 multiple choice answers from an audience to a computer, I wrote SIMULATE.BAS/EXE. I have just posted it on the tapr/SIG/aprssig/upload dierctory.

Run it and you will see that it will take 8 channels of about 40 MIMS per channel transmitting 0.25 second packets. To get 97% of all answers in in under 2 minutes. (I think, I cant remember exactly).

In any case, this tool is a great way to see how many UI packet stations can fit on a channel and all be heard in how much time. My next version will include the effects of a digipeater (if I get around to it...)

81. Nautical Chart INTERFACE!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 5 Mar 1996 17:06:34 -0500 (EST)
To: aprssig@tapr.org
Cc: Robert Bruninga <bruninga@greatlakes.nadn.navy.mil>
Message-ID: <Pine.SUN.3.91.960305165542.9525B-100000@greatlakes>
Rendered body type: text/plain

I just interfaced APRS to a commercial program called CAPN. It is a full featured navigational program using the new formated CHARTS available. In the CAPN program, it looks just like you are looking at a standard nautical chart... What the CAPN folks have done is add a HOOK so that APRS can grab the current POSIT.

This means on a dual COMM port PC, you can be running CAPN (who is looking for GPS data on one COMM port) and doing all your navigation stuff, while having APRS running in the background and handling the external communications with the TNC and radio. In otherwords, APRS remains aware of your position and keeps the radio channel informed of your position as well as being able to send and receive messages.

Notice ONLY your location shows up on CAPN, but all other APRS boats show up on the APRS screen, and APRS keeps you in comunication. Really, all this interface does, is allow both CAPN and APRS to share the GPS data that is comming in on the GPS port, but if you are going to spend $500 on a full featured bit-mapped navigational program, this allows you to still run APRS without running out of COMM ports....

OR, of course, you can run CAPN shoreside, and use the APRS serial port interface to send over ALL APRS POSITS onto the CAPN displays! They will not be labeled with callsigns, but at least you can see where they all were...

82. Frequency Coordination

From: dwetzel@uswest.com
Date: Tue, 5 Mar 1996 13:49:55 -0600
To: aprssig@tapr.org
Message-ID: <13c9d640@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Apparently our frequency coordinator here in Utah isn't going to make a move until he hears the ARRL "blessing" on 145.79.

Is there anyone out there who knows the ARRL position (Bob?) on 145.79 as a recommended frequency for APRS? We've been fooling around with this coordination for six months, and are starting to get too many users to wait much longer for a move to a permanent home.

TIA

Doug
KC7CO

The 80M APRS frequency is being tested in FL so far by myself N2CZF, KD4UYR in the Tampa Bay area, and WA6RTX all over the state in a RV last headed for the Panhandle.

We have had others testing in the past but as with most other things interest has dwindled over the past month or two. All in all I am quite pleased with 80M, it does have it's problems but it does allow some communications that we are not able to hold over a VHF or 30M path.

AGAIN WE ARE LOOKING FOR MORE STATIONS IN OTHER AREAS OF THE STATE !!! I REALLY WANT TO HEAR FROM THE JACKSONVILLE, MIAMI, AND KEYS AREA. We have some plans in the future for South and Central coverage but maybe more areas and we need more tests.

I think the random wait function is a great idea. MFJ uses that idea as their "anti-collision" scheme.

here is my toss into the ring.

Make the devices sequentially transmit their data up the line to the next machine then up the line to the next machine.   Then lets say 5 of the devices xmit all of their data from 20 end users ... Follow me ?

OR establish a NODE that is responsible for 10 devices. The node will be responsible for final uplink to main unit. Say, 10 nodes competing for time, add the random wait timer. You could have many more end devices this way. Each individual device can be only linked to a node device.

Do I win ?   :)

I think this is a wonderful idea if you add a twist to it. Modify the program
and call it MESS.BAS/EXE and have it do a simulation of what will happen if too
many stations are configured as a WIDE in a "small" area!

Show the theoretical collision rate, average time that a packet will need to get
thru vs. what it would have been if not as many digi's were seen etc.

It will probably need to have a few assumptions made but may be a great training
tool. Have a option for chosing how many wides you want to send a packet thru,
and another for how many wide's you can actually see on your screen.
For instance, TX path is WIDE,WIDE,WIDE, and I can see 7-8 WIDE's on my screen
at any time!

You may wish to gather information from the Freq Coord's in all other states as
to the status of APRS/145.79 coordination.  Kansas has the frequency coordinated
for exclusive APRS use as of August, 1995.  We're getting ready to make the push
here in Missoui, too!

How far will the transmitters be from the receiver?

     A type of user feedback that alerts the user that his button
     press has been acknowledged is good to have,
     will a method of visual or audible feedback be ok from
     the controller at the receiver end? The user can keep pressing
     until he gets an acknowledge if the distance is not to
     far.......

     73, de Ted

Author:  aprssig@tapr.org at CCGATE
Date:    3/1/96 10:12 AM

TO THE SIG,

Ok, here is a BIG question with a FREE prize.

We have been approached by a University to produce 300 HPVFC/MIM units that
transmit a ID and A,B,C or D answer corosponding to a button press. These are
students transmitting answer packets for a lecture survey to be received by a
scanner for software retrieval and ultimatly printout for data calculations.

The BIG question, how can you cost effectivly, with out data collision
receive three hundred packets at once? Keep in mind that each student needs
time to think about their answer before they depress a button. Having 300
custom made crystals would be very expensive. And transmitting at 300
different time delays would take too long i.e 5 minutes total if they were
all at different incrementing 2 second delays 60 packets per minute, they
would all have to transmit exactly at the same time to get the timming right
and the receiver would have to scan very fast with each consecutive delay
consecutively in the scanners memory. The transmitters would be 10mW RF for
those about to FLAME me.

Please, only reply if you have a good solution or answer.

The winner gets a FREE HPVFC transmitter for a practical, working, ideal
solution.

GOOD LUCK!

  (Note: the 24Meg freq may be in error, someone correct me if so)
==========================================================================
```

The low bands will provide more activity and longer distances to the other station. While a VHF TNC works at 1200 bauds, on the Low Bands, you will need a TNC that will operate at a 300 baud rate. Several are available. Ideally, you should opt for a TNC that will allow for simultaneous operation (GATEWAY) on the low ands and also the VHF band. This allows you to link (GATE) the HF data from the HF band, down to the VHF side. To see the newmerous HF out of state APRS stations on your local VHF network band. (VHF 145.79/14501 & few others.)

Please read the HF.TXT file in the programs README.DIR. This will enlighten many on the HF to VHF only use of GATEWAY stations and GATE paths.

QSO among yourselves on testing the SUGGESTED frequencies, let the rest of us know. Am willing to help, need date,time (GMT) and freq and will give it a go OM..

73's & Enjoy, Bill/WB6LPG SanFran Bay Area 30M reliable GATEWAY station, on daily.. See Feb issue P45 of Cruising World for APRS for Yachting Hams. Off mexico more S/V appearing, QSO and encourage the Yachting World about APRS.

Rendered body type: text/plain

Ill look at that. One thing that APRS is doing for about the last 6 mos is running a sliding average. For each WIND speed from your ATTACHED U-II, I take 25% of the new reading, and add it to 75% of the old reading. When reading the Ultimeter every 15 seconds, this gives a good 1 minute running average wind speed vice Peaks.

I was reminded of this while testing the U-2000 with a fan. (constant speed). the U2 would be reporting 15 MPH, yet the first reading was 4! then after a minute or so, it was catching up to 15...

Subject: [APRSSIG:7225] Problem with hearing my Digis

I've seen other folks mention this on occasion on this sig, but it happend to me *again* today and its time for me to mention it.

I run two 24hr APRS stations. One is a VHF stn at my home. The other is a WX station at my job location. Until recently I was running 6.8a since I kept getting problems with newer versions. 6.8a worked for me.

I recently upgraded the motherboard in my home computer (from a 386DX-40 to a 5x86-133) During the upgrade process I discovered that I had a bad Simm memory chip somewhere. (I had been having problems with the machine for a while) It occured to me that maybe this might also have hindered my APRS upgrade attempts. I replaced the bad memory. I downloaded 7.5 and tried it. Everything worked just fine!

I took 7.5 into work and installed it on my 286 dedicated to my WX station. It ran fine .... until I had to move my office (and my station) from one side of the building to the other....

I was seeing my WX station all weekend from home, but when I got to work this morning I noticed that I kept getting the msg that APRS was NOT seeing the last digi. I checked the TNC (the red xmit LED came on ... and I saw the receive LED come on just after) I checked the transmitter (on proper freg, at high power, antenna connected, etc) I *shut* the TNC off, then powered it up again. I changed my Unproto path a half a dozen times. I did *manual* transmissions with the 'X' key. I shut down APRS and re-booted a couple of times.

Nothing worked ... *every* time I got the Digi Not Seen msg.

Then without toching any of the hardware ... I shut down 7.5 and booted 6.8a .... It worked just fine now!

I'm not saying that this is a problem only with 7.5 because I had the same thing happen to me on 6.8a when I tried running my 8088 laptop "live" mobile once.... (could NOT see any digis, but the recieve LED lit up *every time* right after the transmit LED)

Any comments?

That would entail an ethernet port hanging off the back of a TNC, WX gizmo, etc...

That will leave out 80% of the hams who are still using VIC-20s and C64s.

I would love to see a thinnet or 10-base-t port on the backs of things, would work very nicely, but alas, my TI-99/4 wont do that :)

How are you working the Ultimeter with APRS?
I got the Ultimeter 500 with the interface cable. I have tried to unplug the mouse from com1 and plug in the Ultimeter but nothing happens. Yes I have held the 2 keys down on the Ulitmeter to put it in the packet mode. The tnc is on com2, a PK-900. Wondering if because the APRS prog uses the mouse for the program is this causing a conflict?
I tried to REM out loading the mouse but for some reason the computer wont boot past the CMOS info.
I also tried adding a I/O card that will config to any IRQ and set com3 and com4 to open IRQ's, but if I try that, APRS during set-up, says 3&4 need to be same IRQ's as com 1&2 when you get to the question of "using another com port?". It still didnt work that way either, no data from Ultimeter.
I have seen some messages saying to put the APRS in a different mode then WX?
Can anyone start me off in the right direction? Didnt get much from the doc's.

MacCartogropher (The Map Making program we are working on) will be able
to do this type of conversions....    eventually..

Lets discuss this off-line..  Anyone else interested in this type of
conversions, please send me e-mail direct..  Once we are closer to having
a real solution, we will bring it back to the SIG..

Also, don't expect anything like this to be done until AFTER Dayton.. :-)

Norm wrote

    I am located in Darien, IL. and would like to get a radio email address.

I'm guessing that perhaps you are asking about TCP/IP over amateur
radio, Norm? That's not a subject for this list, but many here
(like myself) do both APRS and TCP/IP.

According to my latest information, the TCP/IP address coordinator
for the Chicago area is Ken Stritzel WA9AEK. If TCP/IP is what
you are interested in, get in touch with Ken and he should be
able to put you in touch with other locals who can help you get
on the air with TCP/IP. Unlike many other modes, TCP/IP over the
air is definitely not something you can do all by yourself and
be successful at joining an existing user community.

There are other options that might be interpreted as "radio email".
Ask me off-line if TCP/IP isn't what you were thinking about.

Good luck es 73

102. Re: [APRSSIG:7245] Maplist Maker?

From: jleonard@tbcnet.com (John B. Leonard)
Date: Wed, 6 Mar 1996 08:34:42 -0600
To: aprssig@tapr.org
Message-ID: <199603061434.IAA20074@tbc2.tbcnet.com>
Rendered body type: text/plain

In every distribution DOS APRS, Bob puts a utility called "Mkmaplst.bas" or
something to that effect.

How it works is you put the maps and the utility in the same directory, by
themselves. Run the maplist program thru QBASIC. The resulting file,
MAPCENS.txt, which map be in a directory other than where you think it
should be, is the basis for your MAPLIST.xxx. Sort the filenames, etc., in
order if you were zooming in and use a distribution maplist as a pattern to
finish it up.

READ THE DOCS! There's all the info there that you need.
If you don't have a distribution version of APRS, go to
ftp.tapr.org/tapr/SIG/aprssig/
to get one.

REPLY: You must re-boot the PC and PREVENT the mouse driver from loading
before you can re-use that port. (I think)

> Yes I have held the 2 keys down on the Ulitmeter to put it in the
> packet mode.

WRONG!  In packet mode, the Ul only outputs one packet every 5 minutes.
It should be in data logger mode.

108. Freq Coordination of 145.79

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 6 Mar 1996 12:50:00 -0500 (EST)
To: dwetzel@uswest.com
Cc: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960306123015.6139B-100000@greatlakes>
Rendered body type: text/plain

```
WB4APR REPLY COMMENT:  To help UTAH get 145.79, we need a DEFINITIVE
list of other Freq Coordinations that can be distributed as a resource
Since dwetzel@uswest.com is currently having a coordination problem, I
suggest that he be drafted to collect information from everyone on the
SIG about states that are coordinated.  SEND IT TO THE SIG so that
everyone knows what areas are coverd and which ones are not.  Be sure you
```

include the following kinds of information. Keep it brief. THanks

FREQ	STATE	COMMITTEE	DATE
5.79	MARYLAND	TMARC, The Mid Atlantic FM & Repeater Council DMARC, The Digital Mid Atlantic Radio Council Not "coordinated" but LISTED. Neither group "coordinates" digital users.	1993

I have heard of coordination efforts and succeses in the following states but do NOT trust my memory as to which are "OFFICIAL". For Dwetzel, use this list as a checkoff sheet to see that you get responses from at least these major areas of activity...

Michigan ?
Wisconsin ?
Ilinois ?
Georgia ?
South Carlina ?
Calif (coordinated in the North on 145.01)
Iowa ?
Missouri ?
Florida ?
Maryland
New Jersey ?
Massachusetts ?
Arizona

Hopefully our Draftee, Dwetzel will edit all responses into a nice resource file for everyone...

109. 40 Mtr. APRS Activity

From: Gordon Fuller <gfuller@netcom.com>
Date: Wed, 6 Mar 1996 10:30:17 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <Pine.3.89.9603061038.A17761-0100000@netcom20>
Rendered body type: text/plain

I have been searching for APRS activity on 40 Mtrs. for some time without much luck. I have never heard an APRS signal on 7085 here in Calif. I have heard some activity on 7091 lssb but most are not APRS stations. I see stations in Colo. quite often who appear to be running APRS but do not send a position rpt. It would appear that here on the West Coast, 7091 lssb is a more active frequency. On 7085 lssb, I only copy Spanish speaking voice stations. 73 Gordy WB6OVH Sacramento, CA.

>> please let me know How can I do it?
>> thanks.

If you can plot your dwg file to a disk, then you can use the following method. KG8GE wrote a program called PLT2MAP (I think) that converts an Autocad PLT file to an APRS map. It is available for him for a small fee. It is mentioned in the Mapmaking Readme files that come with APRS.

KG8GE reads the SIG, and will probably respond as well.   I just can't remember his Email address.

What is 145.79 being used for in Utah right now ?? Many areas do not have coordination on 145.79 but still use it. All that coordination means that the coordinator has given their blessing and many argue if that blessing means anything. I am not saying that coordination is not necessary if needed but it is by no means a REQUIREMENT in some areas.

Coordination should give you protection from others that come on the frequency later on and try to use it for other things like BBS's, Voice Repeaters, Autopatch Remote Bases etc. I have yet to hear of a situation where coordination has provided protection yet, which is a good thing. Seems that many people do honor coordination but it would be interesting to see what LEGAL recourse a coordination would give someone. Let's hope we never need to find out!

Another question I have is if a certain frequency is not coordinated for anything yet and someone requests it who is a coordinator to deny it based on their personal decision ?? I am for coordination but I am also AGAINST any abuses taken by someone in some position of power. This is a gray area since digital coordination is new in some areas and the legal rights of coordination is also new. It's so new that I have never heard of legal ramifications occurring yet. Has anyone had any experience with DIGITAL COORDINATION and the legal impact ?? I would love to hear about any actual cases...

FYI: 145.79 MHz and the UHF Frequency (it escapes me right now) that Bob, WB4APR, proposed are BOTH coordinated to APRS in KANSAS. Coordination was initiated by myself and extremely valuable assistance was rendered by Karl Medcalf, WK5M (Kantronics). The Kansas Digital Coordinating Committee and the Kansas Frequency Coordinator were involved in the coordination implementation.

Missouri is not YET coordinated. I simply have not had time to initiate the contact with the State Coordinator and the Digital Coordinator yet. I AM told, though, that they are open to following Kansas' lead.

More later...

Howdy folks...

May sound stupid, but in the honor of experimentation, I run this by you before I try it.

Wondering about setting up a makeshift GATE here in NE PA. Problem is that I do not have a dual port TNC. I do have 2 MFJ 1270's and would like link one TNC on HF to my other TNC on 145.79 MHz. Can this be done without frying a vital organ at my QTH???

My biggest concern is voltage back to the computer through the DB25. I would like to cross the TNC's as would be done in a backbone configuration of a NODE stack, but maintain the computer connection to my COM 1. I've run this by a few people and answers range from impossible, to only via TCP/IP, to only by using two COM ports on the computer.

In other words... I want to cross over at the DB25 on the back of my TNC on VHF, and connect to another TNC on HF, while maintaining the computer COM port connection.

Would there be a way to inhibit VHF to HF posting and only allow HF to VHF postings????

Hmmmm

Al, N3KAE

> like link one TNC on HF to my other TNC on 145.79 MHz. Can this be done

WB4APR REPLY COMMENT: The answer is NO.

1) Hooking TNC's back to back could be used to send every packet heard on HF out onto VHF, but the the VHF TNC would be applying its own CALLSIGN

```
header to all pacekts.  Plus the original HF header would be included,
and these combinations of a header within a header would not be parsed by
APRS.  Ergo it wont work

2) YOu can always connect any single RS-232 OUTPUT to any number of
RS-232 inputs (within reason).  If you want to combine TWO or more
OUTPUTS to any INPUTS, you must "DIODE OR" them.  With this, you can
combine all kinds of RS-232 things together.  YOu should see some of the
lashups I use.  Three TNC's driving Two computers, etc..  All useing just
diodes and resistors.  Parallel each "DIODE-OR" with a 10K resistor so
some "pull down" voltage is there...

The only way to do what you want to do is to use a DUAL port TNC with the
GATEway function.  Even writing a special code on a PC with 2 COMM ports
is not practical, because you would have to change "MYCALL" in the VHF
TNC for EVERY PACKET!!!
```

Actually, as soon as I hit SEND on that last message, I realized you
could write a program that would listen to APRS POSITS on the HF
frequency and that would then turn around and RE-FORMAT The posit into
tha APRS format for an "OBJECT" and send that out the VHF port.  ALl
VHFers would only see the HF posits and they would all be purple because
they would, in effect, all be objects attributed to YOU as the uplinking
station.

Actually, this program could be very simple and only take a few minutes
and a few lines to write.  Simply take all incomming posits, parse out
the SENDING stations callsign, then send it (padded to 9 spaces), then
REPEAT everything in the original POSIT beginning with the COLON.

Remember tho, ONLY POSISTS.  THis is because only the OBJECT format
permits one station to send information for another.  ALl other APRS
formats require the TNC header info to know who SENT it.
```

122. EME for everyone

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 6 Mar 1996 21:31:35 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960306211302.10591D-100000@greatlakes>
Rendered body type: text/plain

```
In APRS75, I added a dotted line to the CD.map which shows the NAVAL
SPACE COMMAND RADAR "FENCE".   This fence is a FAN radar beam that is
and has been radiated straight up from three sites in Alabama, TX and
Arizona for 30 years.  The line is STRAIGHT and extends at an azimuth of 91
and  271 degrees through all three sites.  ANY space object that crosses
this  FENCE will generate a doppler PING that can be heard by simply
listening  to the CW carrier frequency of 216.98 MHz.  The larger the
object the  larger the PING.  The MOON crosses this fence every day for
about 1/4 of the month at a time.

   Stations have claimed to hear the EME ping using only a dipole.

To see the fence, hit the "1" key to go to the USA map, then hit
MAPS-ALT.  Notice that the line appears curved, because APRS maps are
MERCATOR projections.  Great circles (Straight lines on the surface of
the earth, are curved on Mercator maps).

To use this data, simply use your favorite satellite tracking program and
set up coordinates for the main radar site in texas.  Whenver a satellite
hits an azimuth of 91.4 or 271.4 degrees, it should generate a PING.  TO
see whwere to point your beam, also display the AZ EL from your site, and
at that instant of crossing the line, you can see the AZ EL From your site.

I had wanted to annouce this earlier, AFTER I had heard the moon, but
after a few "kludged clip-lead" attempts, I havent had the time to go
back and try again.  So I have NOT heard the moon, and suspect that my
220 MHz antenna must be NG...

I doubt that I am going to get to it soon, so I may as well pass it
along and see if anyone else hears anything.
```

I know this is NOT APRS related, but I thought the APRS MAP was a good
way to help experimenters visualize the fence.

By the way. the transmitter is 70 MEGAWATTS in to a 40 dB gain antenna
(or something like that...) ANyway it is BILLIONS of watts ERP...
I feel pretty klutzy not being able to hear it.. it is a pure carrier.

Oh, its BEAMWIDTH is only 0.2 degrees (or so, I dont remember that
either, but it is much less than a degree) so the PINGS are short.
(fractions of a second), but I think the MOON takes about 40 seconds,
maybe...

123. APRSgate

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 6 Mar 1996 22:07:47 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960306215311.10728A-100000@greatlakes>
Rendered body type: text/plain

Well, I actually sat down to write the Two-TNC-COMM-PORT-GATEWAY program,
and then realized that if a PC is gonna sit there doing that job, it may
as well be displaying what it sees, so it may as well be APRS! Then I
realized I could add it to a special version of APRS so easily....

So, if there is a real need for this LIMITED APRS gateway
function, let me know. I can do it pretty easily. Here is what it could do:

COM1 is hooked to an HF TNC. COM2 is a VHF TNC. The APRS program is
ONLY participating on HF. But with OBJgate mode set, every
POSIT heard on HF will be send out on VHF as an OBJECT uplinked by your
station. You would NOT be able to do anything on VHF without swapping
cables. THen you would only GATEWAY to HF (a most undesired mode).

Sure, I could write a progarm to monito both (Like I believe MAC/WIN aprs
can do already), but anything other than what I outline above would take
more effort than I have time available for right now... Tho I would
eventually build up to that.

    The question to the SIG is, is there anyone out there that wants to
operate a PERMANENT HF station who does not already have a dual port TNC
AND who is in an area where there are NO OTHER GATES?

Where can I get a copy of the file torchc.bk?.
The ship that i work
on has been asked to carry the torch into Savannah. We are now
looking at the cost and where we will get the money. If we go I will
need a ship icon (three masted barque) Bob. If it is part of the
extension alphabet that will be ok.

You can find out about the ship at
http://www.phoenix.net/~judd/elissa.htm.

127. Source of Cheap Transmitters

From: mark.endicott@nashville.com
Date: Wed, 6 Mar 96 18:10:45
To: aprssig@tapr.org
Message-ID: <199603070702.BAA06816@tapr.org>
Rendered body type: text/plain

I have run across a very small quantity of Maxon VHF Data Modules that I would like to make available to the APRS users on this SIG. They are the DT-0510 model, TRANSMITTER ONLY VERSION. These are brand new units, however they were bought surplus from Maxon in lew of warranty. Maxon has discontinued this model but they are still making the TX/RX version of the same unit. When these are gone there will be no more. This transmitter is rated 5 watts, and is capable of 9600 baud (not tested). They are supplied configured for 2 watts output and are on a test frequency near 151 Mhz. We have been using them on 145.79 (1200 baud) here as APRS stand-alone trackers here with great success.

Specifications:

Size: 2 3/8w x 4 3/4l x 3/4h (all metal housing)
Power: 10.8VDC @ <1 A @ 5W, <.6 A @ 2W (14 V could toast it)
Inputs: DB9 ,(Power p.5) (Ground p.4) (PTT p.3)
(Audio {data} p.1 @ 250-350 mV adjustable)
Output: BNC Connector, 50 Ohm
FCC: Type Accepted for Commercial Service.

Included with each unit is basic technical information and how to modify them for 5 watts. (one jumper) Tune up on 145.79 has been very straight forward with no problems or component changes required, just install the crystal and tune up. Some of the units tested have not put out the full 5 watts, at 145.79 but all have been at least 4.5 W at 10.8 VDC. Crystals are readily available from most suppliers, specify for Maxon CP-0510.

If you want one, send $40.00 plus $2.75 for UPS to me at the address listed below. If you need more information please e-mail me, direct only, or call (615) 889-4756 M-F 9-4:00.

(800)431-2929 Orders Only, ask for Mark
mark.endicott@nashville.com. WB0NOO

Just a personal note on the Freq. Coordination issue....The Kansas people's big objection to giving coordination was the close proximity to the satellite downlink band at 145.80 to 145.99. In the long run they approved the coordination BUT warned that those using 145.79 should be aware of the potential intereference to/from the satellite service.

The answer is to use BPQ node software and build the serial port multiplexer cable. Instruction for doing that are included in BPQ distribution (the last time I looked at using BPW). This would use only one com port.

Yes. Simply name the alias of the HF-to-VHF TNC as GATE and give the other TNC a different name i.e. PAGATE. Your local VHFers would then have to specify the actual HF gate name rather than use the generic GATE. If all you're really wanting is to get the HF info gated to your VHF net, why even have the second TNC?

WB4APR REPLY COMMENT: It is one of the PRMARY means that NORAD uses for generating the KEPS for the 7000 objects hurteling through space around this planet. The precise time of the PING tells you when the object crossed the fence, the doppler tells you at what angle and speed, using a phased array receive antenna tells you WHERE it crossed the fence,and with that info you can UPDATE the keps.

For those of you in the Boston area or near it, I'm planning an APRS gathering on this Sunday March 10 at noon to discuss upcoming plans to implement APRS at the Boston Marathon, and other APRS network issues.

Join us at the Red Cross chapter house at 21 Foster Street, Newtonville, Ma. This is close to exit 17 on the Mass Pike.

For more information drop me an email. Talk in will be available on 145.23 Boston Repeater.

>If that's not the case, I'd love to be wrong!

>Michael Markmann VE4MJM |
 ...

I think you are probably right...but (I am not being rude)..so what? If
it requires hooks from Qbasic to assembly or C, then it can be done and
should be done. If an author can't do it because of programming
expertise, then they should seek help. If the program is popular, there
are plenty of hams who have the programming expertise to aid in the
transition. I know w/r to APRS, at least one ham who offerred to help Bob
accomplish this very task. That is one solution...assembler or C hooks
that I am certain are part of Qbasic's capability.

I am willing to bet that a general plea from a software author to help
implement two things would generate the required help:

1. Support for the 16550 uart
2. Support for user defined address and interrupt com ports.

It sure worked for me....I was using a very popular logging/rig control
program, but it only supported the generic com ports. I had another
program that supported the arbitrary definition of com ports. Both are
written by hams. I talked with both authors about each other's programs.
They talked to each other. Guess what: problem solved.

I return to my initial point: it can be done, it should be done but until
the USERS make the authors understand that this is not a frill, but a
necessity, it ain't gonna happen. W/R to APRS, there is a choice for
those in the laptop environment: use a different program without those
limitations, which is what I have done. WinAPRS will support any of 8
com ports, user defined.

I am not making the point for personal gain...my problems were all solved
when WinAPRS beta came out, but that does not change the larger need for
authors of popular programs to move forward with their programming
practices. Let's not forget who the customer is. If they need to charge
more for the feature...do so.

Help!  Several weeks ago there was considerable traffic about 2 meter
bandpass filters that sold for about $90.00  I would like to purchace a
couple but have lost the address.

Does anyone still have the address and am I correct that they worked well?

Thanks,  John Munsey

     Actually KK5SC-9 will be sending RMC data every 10 minutes via
     WIDE,GATE,GATE,WIDE and GGA data every 5 minutes via WIDE,WIDE.

     Being aware of the past traffic on the SIG concerning abuse of HF
     bandwidth, I thought I would keep it to a minimum.  (I hope I didn't
     re-open that thread!)

I'll make the assumption that you've been talking to the C&E folks, rather
than the Position and Navigation Business folks.  Call 800.421.2477 and ask
for the propaganda package and a list of reps.  They can help you.  That, by
the way is the Mother M main number for GPS data.

     Hello Earl,

     Just a note to you about your message on the SIG. The Web Page on
     Elissa is great. I really enjoyed the visit!

     I live in Savannah and have been very active helping with the Olympic
     regattas which have been held as warm-ups for the Olympics. We are
     really looking forward to this summer!

     We have even been experimenting with APRS on the race courses some
     with some interesting results.

     I hope you guys do get to bring the Torch to Savannah, I can't think
     of a better way for it to arrive here. They're really fixing up the
     river front where you would come ashore. The Olympic village hotel is
     right there on the water front.

     If I can help you out with anything on this end let me know!

     Good Luck,
     Card Smith, N4FOR

> longer for a move to a permanent home.

For what it's worth, there is and CANNOT BE an ARRL position on frequency
coordination.  That's what the various coordination bodies are all about.

Go back to your ARRL Repeater Directory, and check out the statement that says
to the effect, that the ARRL "bandplan" is superceded by local conventiona nd
coordination.

For what it's worth, the ARRL generated their "bandplan" attempting to fill a
perceived vacuum.  What they found and are leif to admit is there was no
vacuum but their statement of a plan has caused significant grief to the
coordiantors who have, for years, been actively involved in spectrum
management and bandplanning as well as repeater coordination.

If your coordinator has some issue with 145.79, especially since I suspect
```

it's not within the recognized packet segment for your area, ask him for
specifics. If he's looking to the ARRL for guidance, send him my way and I
will see if I can find out what his position is.

> thanks Scott KE3RKE
>
Ypu are correct. TheNet X8J has several extra alias's that it can use. (BBS,
DX-CLUSTER, AND HOST)
another for RELAY you come up with a WIDE-RELAY. NEVER USE WIDE OR RELAY AS
THE NODES ALIAS. In the node here I have it's alias set to SEV, bbs to WIDE,
DXcluster to RELAY, and Host to TN. The TN is a state designator that a few
of us are using that allows us to add the state abbreviation to the end of a
unproto strings for maximum hops with minimum QRM.
EXAMPLE; callsign (of first digi), wide, TN. From my QTH in Knoxville, TN
hit a node on a mountain top that can be heard by 3 digi's in 6 or 5 states.
With the above string the callsign(s) gets me to the high level digi and the
Wide hits digi's in N.C., Atlanta Georgia, Alabama, and a node just north east
of Nashville. The TN on the end hits one last digi in Downtown Nashville.

From: KG5QD@aol.com
Date: Thu, 7 Mar 1996 19:05:59 -0500
To: aprssig@tapr.org
Message-ID: <960307190557_344350274@mail06.mail.aol.com>
Rendered body type: text/plain

```
I am running BPQ as a HF to VHF crossport on APRS using a DRSI card and here
are some BPQ quirks-
        On HF there is no digi of heard packets- only output is on vhf
        HF portalias is FLGATE- Node Alias is GATE HF port will digi anything
address to
              either to vhf
         VHF portalias is WIDE- heard packets sent to WIDE digied on VHF only
```

There are two HF aliases so that when I QSY after 30M dies to 80M I don.t
have to reconfigure BPQ.I also modified the IMB terminal program that came
with the BPQ package to output the heard packets to a serial port feeding
another computer so I can monitor and plot the things heard using ARPS. The
command mode stuff goes to the bit bucket and ARPS seems happy with the
Data.(Thinks its connected to a TNC2) One problem is that I dont have control
over which port the APRS local packets go out of since I am using the BPQ
broadcast function. If you don't set an unproto path on the HF port it would
go only out the VHF port. By the way the BPQ software appears to be bullet
proof-

(A note to Bob - Wb4apr- a software hook to the host mode of BPQ in your
software would allow up to 16 ports using BPQ- how about a HF to VHF to
Salellite to 9600 baud backbone crossport digi?)

158. AEA TNC help needed!

From: Tom Weeden <tcweeden@execpc.com>
Date: Thu, 07 Mar 96 20:03:37 -0500
To: aprssig@tapr.org
Message-ID: <199603080206.UAA04288@mail.execpc.com>
Rendered body type: text/plain

I'm working with our county's emergency management agency to put APRS in their radio room. Today I loaded it on an existing 386 which is already connected to an AEA DSP-2232 TNC.

The TNC runs fine under PROCOMM with 7-E-1 settings, but when I run APRS, it looks as if the software defaults to 8-N-1 and I get some garbled characters. Is there any way to tell APRS to work with EVEN parity? Or tell the TNC to go to 8-bit words? (The AEA manual said 7-E-1 ONLY, as far as I could tell.)

AEA users, please help!

Thanks

>I take it that to get out of GPS mode on the TNC
>(to return to APRS, for instance), it's just INTFACE TERM, and then also
turn
>the beacon off.

MIke in order to exit gps mode, just issue three (Ctrl-C)'s about 1 second
apart. Hope it all works out for you.

If you have access to another tnc and radio, you can use the MYREMOTE command
to set a callsign to use to change parameters without having to disconnect
everything.

Good Luck, Hector KE6VRL

There SHOULD be a command to set Parity and 8Bit words. Look for PARITY and
8BITCONV (not exactly sure on 2nd one).
Just change the TNC settings, then modify your Procomm to match and you should
be in business....

Yes, that's correct Ralph... Thanks to you & Truman. You guys responded before I
got a chance to. Any else who is interested in creating APRS maps from AutoCad
data can contact me directly via E-Mail at jimk@on-ramp.net.

To the fellow who was asking... Please send me a personal E-Mail at the address
shown above. I'll be out of town for the next couple of weeks, but should be
able to get back with you shortly. You might include what version of AutoCad you
are using, and whether or not your version is an international or domestic
version of AutoCad.

I'll be spending the next few weeks in Grand Rapids, Michigan. Of course the
laptop, GPS, and APRS will be along for the ride too. Anybody doing any APRS'ing
up there?

I just don't understand all this hoopla about beaconing to VHF from HF
what does it do for either, maybe someone should fill me in. What good
is it to the average VHF user anyway?. What if ALL the VHF users decided
they wanted to do the same thing?. Well i should explain that i have been
doing that anyway!. But i still don't understand WHY what good does it do
other then what it was designed to do. I could understand if it was of
some good to the community in case of heavy weather or disasters, but i
never see it used for anything like that. I fail to see what it does for
the average APRS VHF user. All i see is some HF station showing on the
map that i'm told i cannot (Or should not try to contact). I know i'm
going to get some flames from this again but so be it Hi. I would like to
see APRS progressing for the good of the TOTAL community and not just for
those that fell their ego's hurt when they cannot have their station seen
all over the US. Please someone explain the benefits to me so i can
understand all this talk about HF to VHF gates. Maybe i should start
talking more about VHF to HF beaconing to keep up with all this talk
about gates. I have been laying back reading all this but had to get into
the thick of it again folks.

Bob I can't find torchc.bk at TAPR can you email it to me?.
If you look at the torch pict you can see where it (the trail) leaves
the coast at St Pete's FL. I understand that a USCG cutter will pick
up the torch and tranfere it somewhere off of Savannah and we will
take it in to port.  ( I Hope) ; ^ ).

I have some APRS questions?.  We will be no more than 100nm off the
coast at any time, will 10m or 6m do for tracking the ship from the
land?.  And tracking the torch from the ship?.  As I thank it will be to
far for VHF (in July ).  Or will I need to up my code speed : ^ ).

BTW the Elissa was in Savannah in 1894.  Yes that's 102 years ago.

    I found sufficient sense in Bill's reasoning to discontinue beaconing to vhf
for almost a year? As the traffic increases with the spread of APRS, the
operating
habits established today as acceptable, are likely to become the defacto
standards of tomorrow. The attendant grief may be more serious than the
flames concerning this subject. (Check out 75m at night,if you want an
introduction to ego related grief.)

>Wow that's just great Bob, now everyone will be beaconing ALL HF
positions onto VHF.

Why is it that this response didn't surprise me????
 I think it's great also. I LIKE to see the HF'es and have 3 different gates,
within hearing distance,to chose from,but what the heck,the more the
merrier!!!.
I can not see what the BIG DEAL is. There are all sorts of keys on my
keyboard that will dictate what I see on my map.  If I want to see my local
area, that is all I have to look at and if I want to see what kind of
activity is on HF I can push  F1 and look at the overall picture.
Is there REALLY a problem here (if there is, it escapes me) or do some folks
just like to WHINE?

This is the way that a VHF mobile can stay in communication with its "home" LAN
through the HF gateway system!  That's the ORIGINAL intent of the gateways,
Bill.  RTFM!!!

>What good
>is it to the average VHF user anyway?.

To the average VHF user, nothing UNLESS he/she/it is out of their regular "home"
area...

WAKE UP!!!  Read the previous two comments!!!

>I fail to see what it does for
>the average APRS VHF user. All i see is some HF station showing on the
>map that i'm told i cannot (Or should not try to contact).
I've never seen anything that says you aren't supposed to contact distant
stations on HF or through the gateways!  I think what you're referring to is a
FIXED station using WIDE,GATE,GATE,WIDE for ALL their traffic!  It's not a good
idea to blatantly use the WIDE,GATE,GATE,WIDE path just so you're seen all the
time.  If you're moving and you are either 1) trying to stay in contact with
your "home" area or, 2) your mobile/VHF event is of interest/significance to
more than just your local area!  Example:  During a severe WX event in Kansas
City, I will MOST likely run storm objects to HF to get the information over to
the St. Louis area if necessary.  Of course every situation is different and I
try to adjust my path to meet the desired coverage area.  Since I have direct
VHF northward to OMAHA and DES MOINES if I have a storm front, etc., moving in
that direction I'll stay on the VHF side...

You must not have been using APRS for to long like i have, i have seen it
several times during a period of heavy weather that we where attempting
to use APRS for that community service between the RED+ and the HARC
club, but because of the many many HF messages going back and forth it
killed that in this area. They didn't use the one line message either!.
They used the Bulletin feature to send messages back and forth. IF YOU
DON'T SEE ANYTHING WRONG WITH THAT, YOU NEED SOMMEBODY TO TEACH YOU A FEW
MANNERS. You may consider this whining but i don't GROW UP!!!.

Two points

1. One of the neat APRS things is bi-directional messaging which would be lost
with a crippled one way repeat of HF traffic onto VHF.

2. At the risk of sounding like Wayne Green:

Amateur radio is a hobby.  We do it for fun and no other reason.

The state of most ham operators is "appliance operating".  Most of us don't
do it for the self gratification received from building, testing, modifying,
and refining of electronic projects.

Witness the G5RV antenna phenomenon. - A dipole with a questionable length of
450 ohm feeder and an antenna tuner.  - The whole thing radiates, feeder included.
Do you know anyone who has built one from scratch without purchasing a kit?
How about someone who has compared it to a dipole of identical length fed with
a balun and an antenna tuner?

The popularity of these kit is proof that most hams are too inept to measure
and cut wire.  Forget about them home brewing, or understanding something
technical about what they purchase.

Every once in a while, there is a bright light, like Bob B. who fools around
with a new idea, like APRS.

APRS which can be a lot of fun if we don't take it too serious and forget this
is a hobby and not the self appointed radio arm of some pseudo police force,
disaster assistance org., or weird militia group who looks for lost children in
spare time.

Speak for yourself, pardner. As a member of Civil Air Patrol, I am one of many who use APRS for disaster assistance *and* looking for lost children in what you casually dismiss as my "spare time." And no, we are not a "weird militia group." In fact, I am **deeply** personally insulted by that characterization of search and rescue personnel, including yours truly. We may dress in camoflage BDUs but we are not "weird militia" - we are real live human beings - just like yourself - who **volunteer** our time to try to save somebody else's life and/or property. I'm a ham, too - but my interest in APRS is NOT ONLY a hobby, but something I do as a service to my country (we're part of the Air Force's Air Education and Training Command) as well as to the general aviation community and anybody else in dire straits.

I am not mad - but I *am* deeply disappointed and very disgusted.

I'd say that's probably there as a default for
1) someone who is not in a local VHF APRS network...

```
2) possibly to give widest notice that the user is working
under Win/MacAPRS....(notice I DIDN'T say "advertise")

Of course, the end-user of the software package is supposed to be (read IDEALLY)
acquainted with the APRS software in some way/shape/form and would be likely to
change the path in the config file when they edit in their own callsign and
lat/lon....(Oh, well, I can dream, can't I?)

SIDEBAR TO ALL WINAPRS USERS:

I've discovered that you can program your KAM to default to SEPARATE digi paths
by setting the path statement in the WINAPRS.CFG file to a dual-port command
structure:  i.e.

"GATE,WIDE/APRSW V WIDE,WIDE"

This is what I'm doing at my station presently and it DOES work! (undocumented
feature?)

On Fri, 8 Mar 1996, jleonard@tbcnet.com (John B. Leonard) wrote:

This is EXACTLY the kind of scenario that I was portraying earlier today.
Common sense and good operating practice dictate (or at least they're SUPPOSED
to..) that when emergency/health & welfare traffic such as what Bill mentions is
on the frequency that other traffic should yield until the situation is
concluded!  It all comes down to education, folks.  You've got to set up a
standard operating procedure and make sure that everyone in your network is
working within the SOP to insure that we DON'T have problems like this!  Check
out the KCAWG Web Site and read our Recommended Operating Practices
statement...It's probably not the best nor, by any means, perfect but it's a
foundation for us to build on here.

But how many of us actually DO operate an HF mobile in our cars, Bill?  What I
intended to say but didn't make clear was that the VHF cross-country mobile
operating APRS falls into the same category as an HF cross-country mobile.

A notable exception is Peter, W7LUS, who is on the road in his truck constantly!
 If I were on the road this much I'd have an HF rig mobile, too!

Note that this does NOT apply to the casual APRS Mobile traveling around in
his/her own LAN!  Nobody in California, New York or Florida (to name a few)
cares about where I go here in Kansas City so I don't use the
WIDE,GATE,GATE,WIDE in my car.  I HAVE done this in the past and was, politely
and graciously, reminded that I shouldn't do it unless I was on a cross-country
trek.  Been there, done that, too!
(You wouldn't believe how lonesome it can get on APRS when you're out of your
local VHF LAN!  It's about as exciting as watching the grass grow and you
salivate whenever the laptop beeps that it's heard something!!!)

'Twas said:

"1. One of the neat APRS things is bi-directional messaging which would be lost with a crippled one way repeat of HF traffic onto VHF."

IMHO:

Unless I miss the prime reason for Ke4eer's position, in the NOISE, smoke and flames,
he was concerned, primarily, with a lot of useless (though casually interesting) hf beacons, bulletins, hf chatter, experimentation, fixed vhf-hf-vhf transmissions, blah, blah, blah, that is gated into all vhf nets by those that include in their UNPROTO path, that magic GATE word, with at times, a liberal sprinkling of the WIDE word.

I, on hf/vhf, and kc8ark on vhf, have no problem with any and all traffic because we
are all there is, close to full time in this area. All qrm is better than none, and it is appreciated. For those in areas where the vhf net(s) are more mature, and used for a multitude of purposes, I can understand the possible objection to the "junk" that is
my treasure. The use of selective filtering, as APR created, provides a mechanism
whereby vhf stations can ignore the incoming "junk" on an individual basis, but that does not eliminate the actual vhf rf qrm caused by the undesired GATEd signals, or the
offence taken by some, to it.

The previous discussions concerning baud rates vs qrm from hf to vhf, though valid from a technical point of view, do not create any less vhf qrm on the vhf nets. I have marvelled at the amount of "junk" I have pumped into the vhf ether, on many occaisions, and while gating with a TCP/IP setup, I created many trace files on vhf and hf, to read later in the evening, when I came home from work. On the weekends, especially, there has been "tons".

If this issue of hf to vhf qrm is to be resolved, I suspect that a more judicious use of the GATE word in many UNPROTO paths is in order. The use of the WIDE word, should also be considered in the context of shared rf resources, and the qrm it creates. I may cuff kc8ark about the head and ears, to keep him in line, but it is difficult to suggest "better" operating habits to one far removed from my immediate sphere of influence. If anarchy rules, we all lose.

I would hate to see the ability for TRAVELLERS (please note the emphasis :-) to be denied the ability to gate from one part of the country (world?) to another because
of reactions to questionable operating habits. Area gates such as FLGATE, are far from a cureall. If the APRS network is to remain a cohesive world wide? vhf-hf-vhf network the, tit for tat, as discussed, and sometimes implemented, will only mean an APRS network of less value to all. Turning off the gate stations, makes isolated vhf networks. The proliferation of area gates and specific vhf digi calls, makes a laptop, and nationwide knowledge of the network a prerequisite for "simple" mobile operation. I can see the
diversification of the network down the road, but I hope for reasons other than I perceive relevant to the current fire.

I would hate to see the loss of information of value to most APRS users, sent normally throughout the entire network, because of reactions to an ever expanding "flood" of
data of little value to those far removed from its origin.

I hope, that the current ROAR!!!! will subside, rapidly, and a more amicable and rational discourse will replace it.

As I am sure Bill remembers, my "junk" was heard heard in his area.

BTW Bill, if you wouldn't charge out of the chute with a roar, in a cloud of fire and smoke, everytime someone waves a flag, you would see me smile. Some among us play you like a violin while all have to suffer the discord :-)

Pete, wa4hei

Well Bob I for one am runing out of money for PK-900's and KAM+'s I would love
to see that feature or even a more streamlined version of APRS. No Satelite
stuff, etc etc. in it JUST FOR GATEWAY OPERATIONS AND MONITORING. I run 2PC's
here with two GATEWAYS and it get's to be a bit on money. If others want to do
the same hamfest specials can be put to good use for a complete gateway at the
price of one dual port TNC.

I think APRS as is is great for the average user and no other features are
needed at this time but another special version like APRStrak was made would be
good for those that need it. REMEMBER THE HAMFEST SPECIAL I have been given 4
286's here with no hard drive, someone else is giving me 10 meg HD's for free
and I have 6 more TNC's that means I can set up 3 more GATEWAYS at a minimal
cost. Many others may find small HD's for the asking in building such a system
so keep the size of APRS to a minimum. Between the almost needed ProComm+, APRS,
```

and maybe a few utilities in addition to DOS not much room is left for backups
and .HST's.

I thought that the air farce is tracking objects optically..?
(Both from land and air based telescopes)
Besides, whats the beamwidth on a device like that ? If I knew that,
then I could understand it better. A large beam width would make sense.
I was picturing a small "BEAM" and it wasnt making sense.

Point #2 Re the HF-VHF thing...
I operate HF and VHF mobile and at home. The hf side can be
quite busy with qso's and beacons. SOMETIMES it's hard to
even get a beacon thru unless you wait a while.
Someone wrote, something like "I can hit a key and only monitor
etc etc"
That doesnt stop the HF freq from getting tied up though. You can choose
to monitor who you wish, but if everyone is on HF then its still gonna be
slow.   So if your in a QSO, USE THE CALLSIGN OF THE DARN GATE.
DONT USE
 GATE GATE WIDE REALLY WIDE, WIDER STILL, etc for your unproto.

 I am still looking for folks to QSY to some other bands..

I run a loop antenna and operate 10-30 only.
PS IF you ever thought about a loop antenna, get it. Worked a ton
of stations and most of it DX !
My first rtty qso was CROATIA !!

Cant we keep this on a NON emotional level guys ?   We could get
a lot more thoughput and all benefit by it. State your case and
be gone !

Now, b4 flames, just think about what you want to say and then sanitize it
and make your point. NO ENERGIZER BUNNY CLONES ...

Mike KD4EMI
Have a nice day

Well, well, well... Didn't I just shake up a hornet's nest on this one.

For those of you who may be interested, I am the original postee of the
message titled: Is this possible?. It all started a few nights ago when
I was staring at a spare MFJ 1270 TNC and thought... Gee wouldn't it be
nice to see some HF (GATE) stations show up regularly here in NE PA? I
read through the APRS docs and saw a boat-load of info on dual-port
TNC setups, but nothing about a dual-TNC setup. A few of us here in NE
PA monitored the HF APRS freq.'s during the past hurricane season and

were honestly impressed at the effort put forth by the storm trackers. We recently got a VHF WIDE-RELAY on a local mountain (Scranton, PA) and are looking forward to enhancing it this Spring.

Just for the record, our miniscule mountain digi doesn't even have an UNPROTO set, so I highly doubt we would disrupt the entire eastern seaboard's VHF activity by having a GATEway here. But it seems that a few people flew right off of the axe handle over this topic in general. To them I say; GET AWAY FROM THE COMPUTER AND GET A HOBBY!!!

If anyone in particular feels that HF APRS activity is being mishandled, then please stop being the genius in the back of the classroom and MAKE YOUR VALID POINTS KNOWN.

I recently saw a list of APRS freq.'s/proposed freq.'s on this SIG for HF use. There were 3 for each band 80 through 10 Meters. Isn't it time for some serious sub-coordination and policing of these freq.'s??? ie one for WX/mobiles and one for DX/chatting. This should allow for some quelling of this obvious quiet riot, and maybe an agreement and etiquette, en masse, can be established. You, the SYSOPS of the HF GATES should really consider this or some other plan of action, less you be subject to increased frustration when APRS doubles in popularity.

For those of you who lended positive information on a dual-TNC setup; I thank you very much.

Flamers welcomed...

Al, N3KAE

I see the Collier Co. area is using BPQ with FLGATE. Do remember that FLGATE is for the FL APRS NET ON 80M ONLY!! What little there is hi hi.

If you are on 3.585 LSB going to 145.79 in the state of Florida as a GATEWAY use FLGATE as MYGATE. If you are operational on 10.151 LSB stick with GATE as the MYGATE. No one on 30M uses FLGATE since those transmissions are used all over the country, if you are set to FLGATE on 30M nothing will come thru.

>times, a liberal sprinkling of the WIDE word.

Case in point:

Last night various APRS users in the Chicago area participated in a Severe Wx/Tornado Drill. My job was to put the WX on the screen, with warnings, etc. They (the participants) checked in and did all kinds of APRS/Skywarn things. The drill lasted from 7 til 7:40pm.

If we had a GATE operating in the area, the drill would have been fighting against the hf "noise" coming in. Collisions were a concern as it was on VHF. Think about introducing HF noise, HF that can't HEAR!

Ask the GATE to turn off for drills, you ask? I beg to differ with you on the definition of a drill. A drill is performed so that those stations will see the problems, and hopefully correct them. And so the next drill runs a little better. We hope. Of course, next time could be the real thing. No drill.

This Skywarn vs HF gate problem has been a concern for a long time. I just hope that somebody's ragchew in TX doesn't collide with somebody's urging to get outa the way of a twister in IL.

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator
EMail: ku0g@sprynet.com
<---- End Forwarded Message ---->

On this topic I will say that I do on a RARE occasion go WIDE,GATE,GATE,WIDE when I am in the area. I did do this often a few years ago when a GPS tracker was rare in a area served by a GATE. Now that this is much more common I cut back quite a bit, maybe once every 3-4 months. "Back in the ol' days" I was geting messages at the home PC that everyone was having fun tracking me while I was driving arround Palm Beach (Donald and Marla were even followed during one of these trips!).

I don't think a OCCASIONAL track is that bad but things need to be considered. Position Rate, UNPROTO path (WIDE,GATE or WIDE,GATE,GATE,WIDE), but most of all the time you are on. A 30 minute trip with collisions on VHF and faiding on HF will not be a big deal but a 30 minute trip to dinner, with the car in one spot for the duration of the dinner TX'ing every 5 mins would be.

Think of this over the weekend, it will solve many problems and is very simple.

PLEASE USE COMMON SENSE !

From: Peter Markham <pmarkham@sun.lssu.edu>
To: aprssig@tapr.org
Subject: [APRSSIG:7336] Re: HF <-> VHF

Area gates such as FLGATE,
are far from a cureall. If the APRS network is to remain a cohesive world wide? vhf-hf-vhf network the, tit for tat, as discussed, and sometimes implemented, will only mean an APRS network of less value to all. Turning off the gate stations, makes isolated vhf networks. The proliferation of area gates and specific vhf digi calls, makes a laptop, and nationwide knowledge of the network a prerequisite for "simple" mobile operation. I can see the
diversification of the network down the road, but I hope for reasons other than I perceive relevant to the current fire.

Pete, wa4hei
<---- End Forwarded Message ---->

I agree with Pete that cuting down traffic will not be a cureall with such aliases as FLGATE, MIGATE, or XYGATE but the FLGATE was done for 1 reason only and this reason would have created havoc with 30 meters. WE WANTED A LOT OF TRAFFIC, AS MUCH AS POSSIBLE !! I have 2 GATES up 24hrs a day 7days a week one on 30M and one on 80M. KD4UYR I believe only has one but keeps it mostly on 80M now. If we would have made our 80M GATEs alias as GATE and not FLGATE then told everyone on VHF in the area to go APRS VIA WIDE,GATE,GATE,WIDE we would have really been hung to dry! It will possibly be impossible to get everyone to change back to normal operations later on if we killed 30M for the duration of the tests and once 30M came back everyone would keep using WIDE,GATE,GATE,WIDE.

Why did we want so much traffic ?? We wanted 3.585 to be busy all the time so new 80M users could zero beat at any time and once everyone was on frequency then we were going to run a somewhat controlled test to rate the 80M APRS success rate WITHIN the state. 30M is worthless for us to keep in touch with and we are too far spread and large to make use of even the most expensive/extensive VHF digi system. Emergency Communmications is what APRS is best suited for and that is what we want to apply it to. If we do not have the RF link APRS is quite worthless to everyone here unless we need it on a small scale which could be taken care of on any regular 2 meter repeater. We have plans for VAST ammounts of data to be passed in at least the southern half of the state, we do not have the amateur interest yet in the northern region, or at least enough to take into account now. No other band can accomplish this other than 80M so far, and 80M is still not 100% but it is quite good.

With what I have just stated you can see APRS here in Southern FL is making quite a change. Their are those that want to use it for fun and others that want to use it for a more serious mission. Neither group is wrong for wanting what they do but ONE system/gate can't handle it all. Their will be a split probably later on with more users coming into the ranks but all in all we will grow. Some will keep to the day in day out operations, some will be involved in the Emergency Management aspect while others will be part of both activities.

As Pete has stated it will cause a problem but it will be transparent if done properly. 30M gates will serve travelers and routine operations while the 80M gate for FL or any other state will serve a SPECIFIC niche, coverage WITHIN THE STATE. No one in this area is suffering now due to the FLGATE, many probably do not even know that it is here, they just know that TAMPA is a regular on the map now which they were not before. If anyone want's to use it they can, if they do not they follow the standard APRS protocall and things are as usual.

Maybe even someday in the future 3.585 will gate to some other frequency other than 145.79. Either way 10.151<->145.79 will remain as always and offer it's services to everyone. Statewide APRS operations could move to another VHF frequency or even another frequency AND Internet! but that is another ball of worms. I plead the 5th on that topic and deny any comments about it!

I usually remain silent during these discussions, but I had to bite on this one. In most of my ten years as a communicator I have found most hams to respect a published emergency frequency. Maybe you might consider using an alternate frequency for APRS during your community service activities.

No NO, i'm not talking about mobiles. Not yours or W7LUS-14 it's the base to base HF users. I enjoy watching an HF mobile as well as others do, but it's not those users that create the problem. I don't need to tell you Ralph you have been in the midst of some of this, your just not as vocal about it as i am Hi. And i do have to make a statement that since i have been running my station WIDE,GATE,GATE,WIDE from VHF i haven't seen the abuse that we where having a while back. It's just that i see it heading that way again specially now that Bob is helping out. Well if it does we are prepared in this area to all beacon VHF-->HF, what's good for one is good for all i would say. So no Ralph you have NEVER heard me talking (Rather typing a statement) that was directed to HF mobiles. I hope that sets the record straight Hi.

My point exactly, this happened here a while back and the Red Cross gave
up on the idea of ever using the club shack and the club's know how on
APRS simple because there was just to much HF traffic (Useless if i may
say). But there are those people that think during heavy weather here in
North Alabama that it's a joke and that this is only a hobby and that we
should not worry to much about human life.

PS: to let some of you folks know i have received many messages in
support of this, but most feel they do not want their messages reposted
to the SIG and i will honor that request, Specially from down the FLGATE
area.

Rendered body type: text/plain

Why does this subject come up once every three months on this sig?

The primary purpose of APRS is to permit the mobile tracking of GPS stations throughout the United States through a series of digipeaters and gateways. This is why the program was created.

The secondary purpose of APRS is to track weather related events on both a mesoscale and microscale level...as indicated by the large amount of effort in decoding the U-II and U-2000 weather stations and the use in several areas of stand-alone weather reporting stations.

We have been using APRS in the Tampa Bay area since version 1 for both of these purposes quite successfully and I fail to see the problem that other areas are reporting...despite the fact that Pinellas County Florida has the highest number of amateur radio operators per capita in the United States with over 2000 licensed hams in an area of 437 square miles.

We have used APRS to augment ARES drills and excersises and we always use it to augment SKYWARN ops. When traffic gets too heavy, the GATE gets turned off.

And, finally, I spent the better part of my summer uplinking the positions of 24 tropical cyclones in the Atlantic Basin, 19 of which reached named status. These uplinks occurred at the minimum of three times a day...and sometimes six...and thankfully, Peter, W7LUS, helped out when I wasn't available or when band conditions were bad.

Now, you may think these things are a waste of band width...especially the hurricane updates if you live in Minnesota...however; the entire East Coast and Gulf Coast states are effected every year...thats an awful lot of people whose lives can be turned upside down by just one of these weather phenomena.

APRS is NOT intended to replace more conventional packet systems and LAN's. If you want a chat channel...build a CROWD node or just go unproto on a simplex frequency of your choice...or jump onto the IRC bandwagon.

The Florida GATEFL exists to fill an existing void between east and west coasts. The major cities in Florida are just far enough away from each other to restrict reliable VHF comms without a repeater. Remember...we don't have many mountains to put up wide area links. The highest point in Florida is 238 feet, in Jackson County, near Marianna, in the panhandle.

Forty meters is NOT reliable south of 30 degrees N unless you speak fluent Spanish. We receive South American stations, especially broadcast stations, almost 24 hours per day here in the 40 meter range.

So, what's my point? Simple, we all have to work together and be willing to share the frequencies.   Instead of complaining...come up with solutions and work together for the common good.

73 de Kevin KD4UYR
Tampa Bay area, Florida

Let us put the gate controversy to rest. I always say that fixing
the blame is more effective that fixing the problem. I chose to put
the blame where it belongs, on Bob Bruninga [BB] and the
Evil Sproul Twins [EST].
How dare they write programs that are obviously to powerful and flexible
to put in the hands of the general public! Their releases should
allow monitoring only. That would totally eliminate the problems
discussed on this SIG. It would be simple code, just a USA map or
perhaps a few local maps with your own station icon on it i.e. dog,
pickup, gunrack, ET, whatever..

They are totally unresponsive to our needs. I think Keith just
changes the version numbers for an update....heck, he even hid the
fact that you can open more than one window at a time on the mac. And
look at the "simple" problem Bob can't fix, namely, running 72 ports on an
8088. I won't even pick on Mark, he admit's openly, "I don't know
anything about windows." Such a shame. How did they ever get their
license's. Speaking of which, I have been watching with glee the
SIGS regarding HF<> GATES. I propose a 160 meter, 10 watt hf gate.
That should take care of the HF jamming up the VHF. During the
recent tornado drill in the Chicago area, the 30meter gate killed all
the traffic on VHF (I think there was one HF spot, if any during the drill)

And to those in the Chicagoland area who enjoy seeing the spots on
VHF via the gate, I say phooey!! How dare you ask me to contribute
to your viewing enjoyment! Starting today, there will be a .25 per
posit fee for watching HF spots on VHF.

You may submit your two bits to me via Cyber Currency. Believe me,
it will be more useful than your giving me your two cents.

Please contact the authors and insist they be responsible. Put an
end to the wreckless way they release their shareware. Don't send
them a Cristmas card...and above all, those on VHF please put
WIDE,WIDE,GATE,GATE,WIDE,WIDE in your path, even when talking to the
new guy two blocks away. The power company here loves that. Oh, lest
i forget, flatlanders remember, run at least 80watts with complex
routing with WIDE at the end, does a nice job of killing the aprs
net. See, if the code was RIGHT we wouldn't have these problems.

Just a thought

Let's take this further...

Assume that the GATE-keeper is unavailable during an emergency (and face it,
most emergencies can't be predicted), if the GATE were a REMOTEly-controlled
TNC (ala KPC-3, ver. 6) then one or more parties within the Skywarn net
would have the remote access code to shut it down during WX emergencies.

And the primary purpose of APRS may different to you in FL than to me in
CornCounty IL, than to W7LUS.  I would suggest one read the APRS docs to
find out what Bob APR had in mind when he started this.

Thots, anyone?

Hmmmmm....  How does the doppler give you an angle measurement?  I can
understand the speed measurement, but not the angle.  However if, as you
say, you can measure speed and angle then than will infer velocity  and
then that, with position and time, will provide the needed data to update
the keps.

Kevin i aggree with most of what you are saying. Upto this point i
haven't mentioned any name or calls, but since you used W7LUS in your
message i will also. He was the biggest abuser of having a gate and then
using that gate and the APRS Bulletin function to keyboard with another
APRS Sig user in Michigan untill our plans for local support to the Red+
was totally wiped out during a local tornado warning.

You asked for a solution, well i think it should be written into the
software if at all possible that when a person is running a gate from Hf
to VHF that somehow that person's position is shown as such!. Right now
and i say this over and over but nobody understands THERE'S NO WAY TO
TELL WHO'S RUNNING A GATE (Or the so called local GATE). How can you
shoot at something you can't see???

> Besides, whats the beamwidth on a device like that ? If I knew that,
> then I could understand it better. A large beam width would make sense.
> I was picturing a small "BEAM" and it wasnt making sense.

WB4APR REPLY COMMENT: Yep, it is an EAST horison to West horizon beam that is much less than 1 degree wide. It is foremd by hundreds of simple 217 MHz diopoles in a single north south line over a mile long. So it radiates a very very narrow beam in the N/S direction but an OMNI pattern in the E/W diretion. Therefore it forms a thin RF fence of CW engergy, through which satelites fly.

On Sat, 9 Mar 1996, someone wrote concenrning just turning the GATE off when you are doing a special event.....

> I can see where that could be a problem if the "gate" was
> unattended so it could be turned off.

WB4APR REPLY COMMENT: Come on guys, instead of complaining, think about a solution. That is the fun of HAM radio. Here is what I would do with one transistor and one resistor:

Connect the VHF CONNECT LED of the GATE's dual port TNC through a 1 K resistor to the base of an NPN transistor. Connect the Emitter to ground. COnnect the collector to the AUDIO from the HF receiver which is going to the HF port of the TNC.

NOW, whenever anyone wants to "silence" the gate, they simply connect to the VHF side of the GATE. As long as that connection is in place, the dual port station will not HEAR any HF stuff to gateway. The GATEway sysop should set the parameters in his TNC so that this connection will

TIMEOUT after a reasonable time. (1 hour?)

> to VHF that somehow that person's position is shown as such!.

WB4APR REPLY COMMENT: Bill makes a good point. ANY GATE must in
fairness to all in his area, beacon his GATEway symbol on VHF.
You see, the GATE function is totally a TNC function. APRS has no
knowledge that it is connected to a TNC that happens to have GATEway
enabled. If APRS is NOT running, then the TNC will naturally beacon on
BOTH HF and VHF, its position and its GATE symbol. The problem is, that
while APRS is running, it takes over the BEACON function from the TNC and
sets BEACON EVERY to 0, so that the TNC BTEXT and APRS BText do NOT both
get transmitted. But APRSdos only beacons on the band
Selected, NOT ON BOTH. There are 2 solutions:

Any GATE operator shuld use OCT mode and change his TNC BEACON to every
10 minutes on VHF (APRS will have set it to 0). He will have to do this
every time he runs APRS. (This has been long recommended in HF.TXT)

I should be able to modify APRS to do this automatically... Here is what
I will do. If you have told APRS that you are runnig dual port, I will
send out BEACON EVERY 0/10 instead of the current BEACON EVERY 0. I know
this will work on the KAM, will that do the job on all other dual ports?

NOAA sells almost all (by now probably all) the US waters paper charts on
CD. They should be available from any fairly large chart supplier or chart
agent who sells paper charts. These are RASTER SCAN charts and I think a
viewer is available on the CD. Several companies (including my company)
sell navigation packages that will display these charts and place your ship
on the chart using GPS or other position source. The charts are actually
produced and distributed by a private (non government) company. I can't
remember the name, but this should not matter. Check with your chart
supplier or call NOAA.

John -
Many people have sent you the info on DCI, and they make an excellent
product.  It is a bandpass filter as you mention.  I know Ralph Olds, the
owner of DCI and vouch for his products.

I saw another interesting product at the Miami Hamfest.  It is a notch
filter by PAR Electronics of Lantana FL.  Cost is 59.00 and it is about 3"
square and 1" high.  This is microscopic compared to the DCI.

The way it works is:  On 2 meters, much of the garbage you hear comes from
pagers and pther transmitters in the 151-152 MHz band.  The filter notches
this section of band out of your receiver.  It is transparent to all other
frequencies, including 440.  The notch is at least 45 dB, I think.  This
seems to cure the intermod problem in the areas in which I tried it (Miami,
Tampa, Orlando).  I will try it in Atlanta when I come home from this long
road trip.

I haven't bench tested it, but PAR had an analyzer at their booth hooked up
to one.  It showed only about .1 to .3 dB insertion loss!  Notch depth was
as advertised.

I wouldn't have bought it spontaneously, but on the second day of the
hamfest, I was hanging around the booth and 6 different people came up and
told him that they had bought on Saturday and were amazed at the results.

If your interference is pagers, I would look into this device.  The DCI, of
course, is a different design and is designed to pass only 2 meters (the
whole band).  Both of them are excellent products.

I hope to try both of them at a digi site between my pass cavity and my antenna.

Oh 1 more thing.  I tried this test at my hotel.

152.48   Pager transmitter received at full scale.  I inserted the filter
and the signal dropped to less than 1 bar on the S meter.  Notw THAT is
attenuation!!

Think of it as GPS in reverse....one unknown "transmitter", the bounced
signal from the satellite, and multiple known recievers. By comparing the
doppler and time of arrival at 3 different places you get an exact fix
and speed vectors (remember one demension is known because of the planar
nature of the signal. Add more recievers and the fix gets better.

For what it is worth, The GATE I saw in Sanford, FL was using the diamond
symbol on the APRS map. And the one in Souh Atlanta puts VHF<>HF Gateway in
his comments. I have seen it done several ways, but *mostly* the folks
make it known they are a GATE.

Folks, I have a question...

Maybe I am overlooking something, but I have read the KPC-3 manual several
times and not seen anything contrary to this.

When I leave a message to ALL on the mailbox in one of our KPC3 APRS digis,
the PBS will not let anyone else read it but me. It Carries the flag of PN
which means "private" and "not yet forwarded".

Is there any way these bulletins can be made public when they are left? Is
it a seting in a manual supplement I don't have or something like that? I'm
using 6.0 firmware.

These bulletins are for the general info of local APRS users and I only
recently discovered that no one could see them except for me!

Thanks, and please answer here on the SIG.

BTW- The KPC 9600/1200 tnc that was on a node about a year ago had
bulletins that ALL could see.

Talking about new symbols ect..

I'm about to implement APRS in a local search team, First Response Search
and Rescue (FRSAR), here in the DFW area. We are a NASAR, RACES, and
SKYWARN affiliated bunch and can see some good uses for APRS. *Most* of
FRSAR searches to date have dealt with Alzhimers patients who wander away
from the nursing home. So, our search area is typically within .6 to one
mile of the place last seen (aka nursing home).

I am interested in some _SMALL_ symbol to show a search team or dog search
team. A dog? Person or Backpack? I don't know. I don't even know if it's
worth the effort.

Bob's present work on boxes/circles with a number/letter would work ok too.
In fact, this is the way I'm going to do it. That way he (or someone)
doesn't even have to work on a new symbol.

Just as soon as the IRS coughs up my money, look for me in Fort Worth on
145.790MHz (n0nsa-0 or n5xpg-0) going/coming to Hurst and NAS Ft Worth JRB
(formerly Carswel AFB). Now to check on Paccomm's prices....

Cheers, Bill

Ralph, Look at 68 of the KPC Manual dated July 1, 1992

>When I leave a message to ALL on the mailbox in one of our KPC3 APRS digis,
>the PBS will not let anyone else read it but me.  It Carries the flag of PN
>which means "private" and "not yet forwarded".

Corrrect, Private means that only the SYSOP and person the message is
addressed to (in this case callsign ALL) can read the message.

>
```

>Is there any way these bulletins can be made public when they are left? Is
>it a seting in a manual supplement I don't have or something like that? I'm

>

Use SB (send bulletin) rather than SP (send private) any it will work.

there is a command for the kpc-3 that has all incoming messages 'held'...
"PBHOld ON|OFF
 default ON
 When ON, any message received over the radio will automatically be held by
your PBBS for review.
 <snip> Note that any message addressed TO or @ your MYCALL or MYPBBS will
always be held."

It's new in version 5.1

Rendered body type: text/plain

Jack, Dave, Steve- Thanks for the speedy replies!   I found that the PBHOld
command did not do anything for me, but that redoing the messages and
sending them with SB (Send Bulletin) instead of regular S (which is really
Send Personal) did the trick.

The messages were simply little blurbs explaining what the "strange" traffic
on the digi was and where to get the program.

They are working fine now.

I guess my lack of familiarity of BBS use was the cause of this one. Maybe
that is a hidden advantage!
I see far too many of the same message on BBS after BBS all offering the
same thing for sale in an area no one would ever want to go. Like: For
sale 2 sections of Rohn 25. You take down and pick up. And it is in
Oregon and I am in GA.   :)

>

That may be the order of priority that was originally intended, but in some
areas, like here in the Florida panhandle, APRS has evolved with DIFFERENT
priorities. It's primary purpose is for local area severe weather nets.

>We have been using APRS in the Tampa Bay area since version 1 for both of

>it to augment SKYWARN ops. When traffic gets too heavy, the GATE gets
>turned off.
>

That's fine if your HF gateway station participates in your ARES activities and
is willing to turn off the gate during emergencies...but sometime this isn't
the case.

>
>APRS is NOT intended to replace more conventional packet systems and
>LAN's. If you want a chat channel...build a CROWD node or just go

145.790 is our "CHAT" channel. Every night at least 6 or 7 guys are on
chewing the rag...and that serves to keep APRS use fresh in our minds...lay
off for a couple of months and you start to forget the commands :-)
So in effect, it is constant emergency communications training.

>The Florida GATEFL exists to fill an existing void between east and west

Wow! How about that? I live in Florida at 282 feet above sea-level. The
highest point in Florida is actually in Walton County near Paxton...check your
source again...only about 100 miles off I guess!

>Forty meters is NOT reliable south of 30 degrees N unless you speak

>solutions and work together for the common good.
>

We're all in agreement here, I think. But just because HF gates are more
important to you in your area, doesn't mean their first on everybody else's
list. In the Florida panhandle, we lost too many APRS users (prospective
emergency communicators) because they got sick and tired of putting up with
the useless rf-interferring packets. If you run an hf-vhf gate in the
panhandle,
be prepared to get pounced on...folks up here (as I expect they are in Bill,
KE4EER's area) are very touchy about that kind of thing.

>couple but have lost the address.

John -
Many people have sent you the info on DCI, and they make an excellent product. It is a bandpass filter as you mention. I know Ralph Olds, the owner of DCI and vouch for his products.

I saw another interesting product at the Miami Hamfest. It is a notch filter by PAR Electronics of Lantana FL. Cost is 59.00 and it is about 3" square and 1" high. This is microscopic compared to the DCI.

The way it works is: On 2 meters, much of the garbage you hear comes from pagers and pther transmitters in the 151-152 MHz band. The filter notches this section of band out of your receiver. It is transparent to all other frequencies, including 440. The notch is at least 45 dB, I think. This seems to cure the intermod problem in the areas in which I tried it (Miami, Tampa, Orlando). I will try it in Atlanta when I come home from this long road trip.

I haven't bench tested it, but PAR had an analyzer at their booth hooked up to one. It showed only about .1 to .3 dB insertion loss! Notch depth was as advertised.

I wouldn't have bought it spontaneously, but on the second day of the hamfest, I was hanging around the booth and 6 different people came up and told him that they had bought on Saturday and were amazed at the results.

If your interference is pagers, I would look into this device. The DCI, of course, is a different design and is designed to pass only 2 meters (the whole band). Both of them are excellent products.

I hope to try both of them at a digi site between my pass cavity and my antenna.

Oh 1 more thing. I tried this test at my hotel.

152.48   Pager transmitter received at full scale. I inserted the filter and the signal dropped to less than 1 bar on the S meter. Notw THAT is attenuation!!

Sorry folks, but I was the one who initially posted the infamous: Is this possible??? question that has been re:'ed about 40 times by now. Anyway, my intent on the initial question was quite benign and innocent.

Besides the point, and with regard to all of the HF "hash" being brought onto VHF; I was on 30 Meters today and was quite suprised!

Maybe I'm confused, but can someone please explain to me why a long-winded QSO between a few stations (ALL on 30M) needed to use UNPROTO's of W7LUS,GATE,WIDE? Wasn't W7LUS good enough for a QSO? Seems this is a major part of the problem. As I'm sure no one on VHF really cared about the QSO, just the beacon spots. I thought one of the objects of APRS was to minimize your UNPROTO to accomplish an (INDIVIDUAL) task.

For POSTINGS, the above mentioned UNPROTO would be sure to enlighten a VHF'er, but no need to share an entire QSO with them. It seems easy enough to toggle my UNPROTO on this end.

With this in mind, I wouldn't be too quick to blame the owners of the GATEs, just the users.

```
I went to "fix" APRS so that it would send out the command
BEACON EVERY 0/60 so that dual port KAMS would continue to BEACON their
location/BText on VHF even if they were operating on HF.  Guess what?

The B E 0 command is in the file APRS\SYSTEM\INITTAPR.TNC file.  This
means all we have to do is EDUCATE all GATE operators that it is their
responsibility to EDIT   B E 0  to  B E 0/60,  and the problem of
"hidden" gateways will go away.

Note, on the KAM, BEACON periods are in MINUTES instead of 10's of
seconds, so on the KAM, use B E 0/10...

THIS PROCEDURE MUST BECOME COMMON KNOWLEDGE throughout the APRS
community... Spread the word.  (Sproul Bros may have a different solution
on Mac/Win APRS....)

Thanks for writing it better then i could have. Yes your right we have
lost enough people that where fed up with all the gate traffic. At one
time when we had just started i counted 12 locals users, that's before
we even had a digi. You know how many we have left now that we do have a
digi, 2 regulars myself included!!!!. APRS was growing fast but dying
now. And you people wonder why i get upset with HF gates. I'm telling you
i'm just about to the point of using my coordinated digi for something
other then APRS (maybe just straight keyboarding) since my papers state
"coordinated for packet activity" not just APRS. Like i said it's not the
mobiles or boats, but the base station gates that bother us here. Make
jokes about it rather then trying to help solve the problem. By the way
the local packet group is looking for a good digi site and frequency!.

There ya go again! Now it'll take THREE TIMES AS LONG to get Bill to shut up!!!

You ARE right, though. It's the USERS' fault not the operator of the gateway.
Chances are, though, that the stations may have been using LUS because they
couldn't see each other. They could have been on VHF and were using their own
gateway, too, but given the path you posted, they probably weren't.

People DO need to think about the path they use. The old rule about using the
minimum power necessary to maintain communications also applies to the use of
digipeaters!

Personally, I feel that HID should default to ON. While the justification
of the manufacturers is to say that this cuts down on QRM, I feel that
HID ON allows a digipeater using an alias to ID itself when used as a
digi. My feeling is that complying with FCC regulation on station
identification IS NOT QRM.

BPQ. Dale was asking if there is a way to do so, and if not, how it
might be done to make use of a single computer and a number of ports.
At this point, the ONLY HF we are contemplating is 30 meters...80 is a
possibility down the road.

Using BPQ would allow a number of frequencies to be used, and controlled
flexibility as to what digi's where port to port. First we have to find
a way to do it!
73,
Gary

Rendered body type: text/plain

I've got a borrowed Garmin-45 I'm trying to connect to a Laptop computer.
All I get on the screen is garbled characters, as though my Com parameters aren't right. What am I
doing wrong?

Here's my setup.

Garmin-45 in NMEA 0183 V 2.0 output
Computer (running ProComm) Com parameters: 4800 N-8-1

Please help!

Larry Griffin - AB5GE - <largriff@onramp.net>

LARRY:

R U sure that your cable is hooked up properly? If not try this...

9 Pin		25 Pin	
1	to	8	
2	to	3	plus Brown wire from Garmin Data cable
3	to	2	plus White " " " " "
4	to	20	
5	to	7	plus Black " " " " "
6	to	6	
7	to	4	
8	to	5	
9	to	22	

I think that you'll find that this helps. Also, check your TNC setups.
Follow the instructions given in the APRS manual and the TNC manual....Good
luck, hope to see you on the map....73, Alan, WC7R

To: aprssig@tapr.org
Message-ID: <m0tw7Vi-0001hTC@ic.net>
Rendered body type: text/plain

```
How does one tell if the Ulitmeter is sending any data? I have the 500 and
got the serial cable from Peet Bros.
I have a DOS 5.0 boot disk with no autoexec.bat of config.sys on it and have
tried to run both APRS and AUTOWX and both dont show any data from the
Ultimeter 500. I am registered for APRS and WX.
I run my PK-900 on comm2 and dont have the mouse in comm1 but rather have
the Ultimeter 500 cable plugged into comm1 instead.
Been through the validation process on APRS with the ALT-S routine to set
APRS and WX and holding the 2 keys down on the Ulitmeter for "data logging
mode", and still nothing.
If I try AUTOWX, it asks the usual com questions for the TNC and Long and
Lat but when it is looking for U-II port it comes back and says, "NO DATA ON
COMM 1".
I have actually tried all 3 modes on the Ultimeter 500 with both programs
with no luck. Once I did get gibberish on APRS on the line just below the
status box but it didnt add the gibberish to my BTEXT.
Do I maybe need to run a MODE statement in the config.sys file to wake up
```

comm 1? Any other suggestion's are welcome.

296. Enough is Enough!

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Mon, 11 Mar 96 10:48:18 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.826559298.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

Enough is enough, the crap on this mailing list has gotten WAY out of control.

This SIG was designed to promote and share the knowledge and ideas about APRS,
GPS, and related topics..

It was NOT designed to be a flame-fest... Go do that on rec.radio.something.

I have had SEVERAL people either tell me that they have un-subscribed or that
if it doesn't calm down that they WILL un-subscribe..

If it doesn't calm down, we will resort to making this a MODERATED group..

I do NOT want to do this!!
So, PLEASE keep the flames and personalities out of this..

There have been SEVERAL topics that have come up that, at least in the
beggining, were worth discussing, but people's opinions got in the way of
facts..

Then there are the topics that there is NO correct answer.. And that an
'answer' from one part of the country does NOT apply to another part of
the country.

So, please calm down, and discuss APRS/GPS related topics with dignity and
not flames..

```

> How does one tell if the Ulitmeter is sending any data? I have the 500 and
> got the serial cable from Peet Bros.

REPLY: Run a dumb terminal program such as PROCOMM and be sure to set
the baud rate to 2400 baud. APRS assumes 2400 baud for the Ultimeter, so
it is not user configurable...

Horizon acquisition to closest approach (0-doppler) to horizon LOS.  With at
least 2 passes, you can infer angles for both (thrree passes is better to
refine the longest in-sky dwell time) and back into angles.  If you've got
instantaneous doppler measurements for all of the passes, it's straightforward
math, with a little help from Johannes Kepler to back into angles as well as
velocities... angular velocities, at least!

309. Position tracking via WO-18

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 11 Mar 1996 13:36:41 -0500 (EST)
To: Dave Guimont <G_DGUIMONT@qualcomm.com>
Cc: amsat-bb@amsat.org, aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960311113458.14776C-100000@greatlakes>
Rendered body type: text/plain

```
Dave asked for the BPSK uplink frequency for the WO-18 digipeater,
presumably to try to digi an APRtrak position report like we did with
SPRE.  If WO-18 is going to operate continuously in digipeater mode,
then this satellite could be the basis for world wide amateur mobile
vehicle position reporting.   The 1200 baud BPSK uplink is 145.900.
```

The AMSAT APRtrak software will plot the position of any stations that
digipeat their position and status in one of the following formats:

W3ADO>FM19SX,WEBER-1:Hi!

Here your position report uses your 6 digit grid square in the TO field.
This packet is only about 1/2 second long and permits the maximum number
of vehicles or stations per pass probably close to 200 or more. It will
place you within about 2 miles of your QTH and include any status or
comments on the end.

The more precise format allows you to transmit your symbol character so
that your type of vehicle or station will appear on the map. It takes
longer, almost a full second.

W3ADO>APRS,WEBER-1:@141329h3859.11N/07629.12W>Enroute Europe

This format is the time, an "h", then the LAT/LONG, and the final
character is one of 126 different symbol characters followed by any
comments. The symbols can reperesent all maner of vehicles, trucks,
cars, boats and aircraft.

If you are running the APRtrak software, it will automatically transmit your
position. Be sure you are using a satellite BPSK modem, WO-18 has no
mechanism for noremal terrestrial AX.25 FM signals.

>10.151.51. using aea. looks out of band to me.

If you are using 10.151.51 in LSB, you are actually within band..

I use a modern Solid-State rig that WON'T let me xmit out-of-band, it is
quite happy with this frequency...

It is quite understandable that this causes confusion, and you are not the
first person to ask this question....

Keith

Bill
in defence of w7lus his gate has not been up for a LONG time now
my guess at the time of the incident was a malfunioning wx station that
was tx on vhf every 10 sec. I refuse to identify the party!
other ideas inculde that u could be geting trafic from the atl or athens
digi if a hf user is going gate,wide,wide or a vhf user going
wide,gate,gate,wide,wide the use of 2Xwide at the end is the cause
of many colisions hear in the athens ,atl area we should decide
on a standard for this and so that we can properly space the gates
Bill if there are only 12 users in ur area how in the world did hf gate
trafic shut down ur system and interfer with ur event.
we have 6 users in athens myself having a mobile, another 2 mobiles
and wb4vnt some times has 2 or 3 stations up in addition to a digi and
a gate way, also we are going to add a Gatega or gagate which ever itis\
supposed to be. We also get all of the trafic from atl and alabama
most of the time as well as trafic from western NC. We still have no
problems with maxed out channels. (one of the alabama staions is YOU)
Im sorry Bill i hope u don't take this to personal but ur making

a mtn. out of a mole hill!!!!
Even when i had my Jeep (no gunrack :)) sending position reports every
30 sec to see how close our maps were there were still no problems.
The only thing that i see as a small problem that needs to be addresed
is this X2 wides on gate trafic it does cause problems and we need
to fix it with a nag msg or some thing.

Thanks
Lynn N4YCI
PS Im puting on the fire proof suit bill so put a match to the torch :)

There is APRTRAK, for STS and Sat. tracking, there is Packet Pet, and
PacketLite which are TNC programs, and of course the software that came with
your KPC-3. You might look at upgrading your EPROM. It is very inexpensive
and might open up a wider range of functions for you. I have the PK-232MBX
and a KPC-3. The "3" is my mobil/APRS unit and I think the world of it. Hope
that this helps. Hope to see you on the map...73, Alan, WC7R......//\\

Rendered body type: text/plain

If you are using 10.151.51 in LSB, you are actually within band..

```
If your rig thinks this is out of band and won't let you XMT, then simply
subtract twice the value of your TNC's tones and operate USB...

For high-tone TNC's this is 10.147.26 or for low tone TNC's it is
10.147.6  USB, but the convention is to state frequencies by their LSB
equivalents.

Remember, you get multiple readings at multiple different recievers for
each pass through the beam, all with different dopplers and arrival
times. It is exactly the same mathematical problem as your little
handheld GPS solves every second, but  with one transmitter and multiple
```

recievers. And it only takes a single blip, not multiple passes. There
would be no way to match up the blips from different orbits, unless you
already had the keps!

Hi Lynn, no need to put on your fireproof suit Hi. Yes i noticed that
W7LUS hasen't been on for a while other then his 18 wheeler W7LUS-14. No
never did have any problems with VHF traffic other the there are several
users in your area that insist on keyboarding using a path something like
Relay,KD4DLT-7,N4NEQ-2,N4KMJ-7,N4NR-7,WIDE,WIDE. No need to tell you
who i'm talking about either with this path, then local keybaording gives
us everything several times. We locally just use KE4EER-5 nothing else!!.
I have seen many other variations of that path. No Lynn like i said there
has not been that problem lately since W7LUS used to keyboard with the
fellow up in Michigan. But the reason i was concerned with all the talk
on here about more and more gates beaconing to VHF. Path's should be
adjusted many times to fit the situation, i for one change mine very
often depending if i'm using my beams or an omni antenna, and also by
the direction my beams are pointing. You APRS users in the Atlanta area
have a great setup, but it takes cooperation between ALL area users not
just a couple. The biggest problem i see (That you don't see) is that the
N4KMJ-7 has a realy realy bad receiver, but a great transmitter,
therefore we hear everything beaconed trough it but can't send nothing
back trough it. I have done some tests using my stacked beams and 300w
and still cannot hit that digi, yet it shows in my D list as receiving
it direct!. That realy is a problem. Anyway i better get off this wagen
or i will get Bitched at again for posting messages that are to Loooong.

Bill KE4EER

    Thank you Keith - My finger was getting tired of hitting the delete
key on 120 out of the last 135 message. I believe that there might be a
bunch of folks like me who have just been sitting back, reading the sub
for the last couple of month, afraid to pop in due to:
    1) Lack of knowledge (due to our refusal to take the time to
       shift throught all the doo doo to find any worthwhile imformation.
    2) A great desire not to get our hinies singed. (Once burned, and never
       forgotten.)
   Can you imagine what would happen at the Dayton Eyeball if everybody
showed up with their sholder chips. We'd have to call out the riot squad.

   Wether this thing is moderated or not, I'll lerk around in the
background, sharing what limited knowledge I have when the need arises.

>>Bill, I have said it before, I'll say it again,,,the GATE must ID sooner
>>or later....generally once every 10 mins....elsewise its time to get the
>>DF team on alert...

>>My ID string is:

>>KD4UYR>ID KD4UYR KD4UYR-1/M ECHO/D GATEFL/G KD4UYR-7/N

>>Look through your beacon list and find it!

>>de KD4UYR
```

And also many GATE's do use the DIAMOND ICON to state that they are a GATE. If the ID string get's erased by a APRS BTEXT look for the Diamonds. Now if the station has not set their Beacon for the non-operative APRS baand that is a different story! I have always set my beacon to to every 30-45 mins if I am working in a single band mode. This way the diamond will show up even if I am on the other band, as far a proper ID the ID string as Kevin pointed out will come out to satisfy FCC regulations. It will not stay on screen since the APRS BTEXT will take it over but with these two their is enough ID'ing to keep everyone informed.

> already had the keps!

Survey disagrees.  If you know that a station is, indeed, the same object on
2+ passes, you can solve the equation to a Keplerian set.  Did that research
about 5 years ago.  I'd not recommend it save to drive one bonkers, though.  I
first started thinking about this when DOVE was young, and actually asked N4HY
to give me 4 consecutive passes with carrier and no modulation.  He "politely"
declined, and on reflection, I agree: It'd have drained the batteries.
Specific AOS and LOS times and azimuths are required to solve the series.  TCA
is obviously available.  Dopplers over time are also achievable.

And, you're correct in the analogy that it's the same matrix the GPS receiver
solves all the time.

73, gerry

334. WHATSITGPSANTENNA

From: mark.endicott@nashville.com
Date: Mon, 11 Mar 96 23:35:16
To: aprssig@tapr.org
Message-ID: <199603120542.XAA27582@tapr.org>
Rendered body type: text/plain

Ever since I got my first GPS I have found the subject of external antennas interesting and thought provoking. There have been several attempts to use non-amplified patches with mixed results. It was not until Bob (APR) mentioned that he was comparing a vertical 1/4 wave whip that I realized that the miracle of lock could be accomplished with something other than an amplified antenna. I also thought that it would be better if I could use a standard NMO type mount on top of my vehicle. Slamming doors on coaxial cable at 1500 MHz didn't seem like a good idea. I mounted a 1/4 wave antenna, 1.75 in. tall, on the roof of my Jeep and it did in fact lock.

However, I soon found out that the birds overhead and at high angles were seldom visible on the GPS 45 screen. It seemed obvious that a vertical antenna was not the answer. Remembering the patch antenna articles, I decided to squash the vertical antenna down to a flat disk. I cut a 3.5 in circle out of PC board with a circle cutter and bolted it to the 5/16 (24) stud that protrudes from the same 1/4 wave mount that I had been using. The mount holds the disk about an inch off the surface of the roof. I had 17 feet of RG-58 cable already attached to the mount. To my surprise, instant lock, and the high sats. were now visible. The signal strength was not equal to the attached antenna standing beside the car, but it was useable. Next, I replaced the RG-58 with Mini-8 and cut it down to about 10 feet long. Now it works better, total cost "cheap". From my location and with my GPS-45 I have had no problems with this "antenna thing" for the last week or so.

I have a few questions for you engineers that know about this stuff.

1. Assuming that at uhf, capture area is an important consideration, should I try a pizza pan?

2. Knowing that the diameter of the antenna element effects the Q and bandwidth, what the heck have I done? Is this antenna really horizontal or is it a very broad band, but short, vertical? Or, is it just a hunk of metal that works?

3. Without matching sections what is the impedance of a center fed pizza pan that may approximate a 1/2 wave or full wave at 1500 MHz. Or, does it matter with the GPS-45?

4. What about amplifiers? I don't see why one of the little 20db modules wouldn't work. or perhaps a good FET, any ideas?

I have now made three of these little "things" and they all work the same. One used a Larsen mount and the others used an Antenex mount, no noticeable difference. A butter tub makes a good radome, a contribution from a Nerd friend of mine. Cut a hole in the lid and put it around the NMO mount and snap the top on. WARNING yellow tubs make you look like a taxi.

I am only posting this because Kieth has chewed us all out about flames and I feel safe.

Patent Pending...........Mark WB0NOO

Well Lynn actually Ardmore,TN is about 30 NW of KE4EER-5, i guess that
would depend on it's coverage but don't think it would hurt it any. I
don't think we have to much trouble getting to Nashville, it's Atlanta
that we have a hard time reaching, and that's what's so bad about N4KMJ-7
if it's receiver was working the way it should that would be a great digi
location. Jack told me that he knows about the receiver problem due to
all the other digi's on the same site. But in answer to your question i
don't think it would hurt us any to have a digi in Ardmore if it is a low
power digi.

But that isn't the situation here...all the government "fence" gets is a
bunch of pings...it must be able to get the keps from a single pass.
There is no way for the system to know which set of pings are from the
same object. I agree there is a way to do it for a single object which
can be identified over a series of passes, but that info isn't available
to the gov't system.

338. Re: Position tracking via WO-18

From: kc4yer@amsat.org (Philip Chien)
Date: Tue, 12 Mar 1996 04:08:54 -0400
To: amsat-bb@amsat.org, aprssig@tapr.org
Message-ID: <v01510101ad6ad37f5dfc@[155.212.21.16]>
Rendered body type: text/plain

Bob Bruninga <bruninga@nadn.navy.mil> said in response to a question by
Dave Guimont <G_DGUIMONT@qualcomm.com>:

```
>Dave asked for the BPSK uplink frequency for the WO-18 digipeater,
>presumably to try to digi an APRtrak position report like we did with
 ^^^^^^^^^^

>SPRE.  If WO-18 is going to operate continuously in digipeater mode,
>then this satellite could be the basis for world wide amateur mobile
                     ^^^^^
>vehicle position reporting.
```

<assorted comments about how APRS is so efficient and wonderful deleted>

I did not see the original message from Dave Guimont. Only Bob's response
which appeared publicly in the AMSAT-BB server.

But with qualifying words like 'presumably' and 'could' I've got to wonder
what the original question was, and whether or not it had anything to do
with APRS, or even position location at all. On the face of it all I can
discern from the original message is that the sender asked what is the
uplink frequency for WO-18.

With Bob's forceful (to use a tactful term) encouragement for APRS as the
world standard for tracking and position location transmissions, and past
history of encouraging the use of APRS even when it's been actively
discouraged I've got to question what's the background behind this question
and answer - or even why this answer is appearing publicly in the AMSAT-BB
server.

I do not know whether or not the original question was a public question in
the APRS sig, or a private E-mail request. But I've got to really question
just posting an answer in to the AMSAT-BB and APRS sig which encourages the
use of APRS without any detail about the original question. It's a
fundamental rule of netediquite to provide enough information from the
original question when responding publicly, so it can be understood in
proper context.

Bob's post brings up several questions:

1) What was the original question?

2) Did it even have anything to do with APRS?

3) Has the use of APRS been sanctioned or condoned by the WO-18 control
operators?

4) Has the use of APRS been discouraged by the WO-18 control operators?

5) Why is the sky blue? (well, I could look that one up ...)

>like we did with SPRE.

I felt that I had to respond to that clause separately. Before STS-72 Bob
was heavily hyping APRS and SPRE and how wonderful it was. Fine, SPRE was
the first amateur spacecraft to authorize and sanction the use of APRS and
it's certainly okay to promote what you're doing (within reasonable
limits).

Overall I've got to say that I was underwhemed by the use of APRS with
SPRE. I've previously posted my comments as an observer, and somebody who

tried unsucessfully to get through.

But I've got to question the claims made about how wonderful APRS would be for spacecraft applications. There were only a couple of CONUS passes by SPRE before it failed, but that's not APRS's fault. Within those passes there were what - under 100 successful contacts? Overall less contacts than many SAREX missions running packet with a similar period. So I've got to question the claims about how efficient APRS is, and the continued claims after SPRE's flight.

I don't really see how a horizon to horizon measurement can be derived from the reflection off of a spacecraft passing throught he Norad curtain. Considering the width of the beam and, at least for grazing satellites (not Cows!), it would be an instantaneous ping. Higher objects would be in the beam longer, but certainly not provide a horizon-to-horizon presence.

Steve Dimse had suggested to view the problem as though it was an inverted GPS geometry. That makes some sense if a precise measurement of time is available and synchronizing all receivers. But that does not explain how a doppler measurement can provide a angle and speed.

My guess is that no single pass occurance would be useful to fully characterize an unknown object. The elapsed times of passage of a single unknown would ultimately infer orbital period and therefore the trajectory semi-major axis. Other measures might give precise position at the time of curtain passage. I don't yet see how the curtain is used to identify eccentricity, argument of perigee, inclination, or the ascending node.

I finally got around to editing together a track history file of the SPRE
mission from all the log files submitted.  This file may be replayed in
APRS or APRtrak and you will see the track history of the spacecraft and
the positions of all stations that were successful in digipeating their
position via the spacecraft.

     During replay, you will see the same thing that APRS users saw
during the mission.  You will see the spacecraft approach the land mass
and when it comes in range, you will begin to see stations popping up on
the map.  The only areas that reported contacts were in the US, South
Africa, Japan, Hawaii and Austrailia.

     We are still trying to analyze the GPS position reports received that
actually reported the SPRE position, but for the purpose of this file, I
entered these positions from orbital predictions.  I think if you replay
this file, you will find the visual representation of contacts to be far
more interesting than watching the teletype style form of SAREX packet
contacts that was designed over 10 years ago.

     During the first REPLAY, zoom out to the whole world so you can see
```

```
all contacts in the file.  THen you can zoom into to specific areas and
replay again to see better detail.

The file name is SPRE.HST which has been posted as spre.zip for ftp from
tapr.org in the directory tapr/SIG/aprssig/upload.  This file also
includes the file SPRE.BK which can be LOADED into APRS/trk to be able to
see the actual packets and locations of all stations without having to do
continuous replays.

I recently had the opportunity to analyze the "eggbeater" (crossed
full-wave loops) antenna. Its pattern is very similar to that of a
crossed dipole, depending on how you mount it above the ground plane.
Both of these have thet property that th pattern is only truly
circularly polarized directly overhead, and collapses to linear on the
horizon. Also, max gain occurs overhead, where what you would like is
max gain on the horizon, since the slant range to the birds is longer.
The simplest antenna which seems to satisfy these requirements is the
quadrifilar helix. A full-wave quadrifilar is no more difficult to
make than the full-wave eggbeater. The quadrifilar, and to some extent
the eggbeater are great antennas in that they are relatively
unaffected by modest ammounts of nearby metal (other antennas), both
in their pattern and swr.
An interesting alternative to try might be the canted turnstyle
antenna. I built one of these for my Magellan Trailblazer XL, with an
NEC pseudomorphic FET at the base- it works well, much better
indicated signals on the idiot bars on the display. I also used a
disposable plastic coffee sup as a radome. I have not put it on my
vehicle yet, I was thinking of fixing it to my mountain bike. I used
the FET because it gave about 8-10 dB of gain with only a couple mA of
current from the GPS's 5V on the center conductor, rather than the
25-150 mA some active antennas seem to want.

I think this is wrong. I built the WO-18 spacecraft receiver and it has NO BPSK capability. It is straight FSK, just like in AO-16 and LUSAT.

The downlink on WO-18 (like its mates) is BPSK. Perhaps there was confusion because the modulation formats are different on up- and down-link?

351. Position reporting via WO-18

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 12 Mar 1996 13:40:10 -0500 (EST)
To: amsat-bb@amsat.org, aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960312131720.7122A-100000@greatlakes>
Rendered body type: text/plain

In response to some missinformation in Mr. Chen's panning of APRS experiments, I saw nothing in the AMSAT invitation to digipeat via WO-18 that indicated who's packets were good, and who's were bad.

Further, I have never advocated APRS or APRtrak stations to use MIR as a space digipeater, and in any case where my comments where missinterpreted to think so, I have soundly restated that MIR should not be un-invitedly used as a digipeater for APRS packets. What I had observed is a large number of stations digipeating LONG BEACONS containing their CITY and STATE via MIR. I was only suggesting that those stations that seem to be compelled to digipeat via, or to friviously connect to MIR, could significantly reduce their packet size (and QRM potential) by using a formatted LAT/LONG or grid square report instead so that at least their packet could be automatically plotted on a map.

Clearly MIR is a precious international amateur radio asset in space and should not be abused by anyone. I have endorsed and fully support an AMSAT proposed message that would clearly state that UI frame digipeating via MIR is strongly discouraged whether they are EGO beacons or APRS position reports.

I would, however, propose an exception for aircraft and ships at sea more than 200 miles offshore where their chance of a one packet position report would cause no QRM, and where such a single packet would have enough value even by Mr Chen's standards.

     Gee, Paul, are you asking for a survey?  If so:

Processor: PC clone 486DX/2 50MHz
Hard Drives: 420Mb & 1,260 Mb
RAM: 12 Mb     TNC: KPC-3 Ver. 5.1

Packet programs:
     Graphic Packet Ver. 1.61b
          Very versatile & easy to use, up to 10 simul-
        taneous connects, saves to hard or floppy disk,
        supports 7+, many other features.
     WinPacket Ver. 5.4
          Built-in scripting, can be used in a multitask-
        ing environment, will automatically pick up mail
        and new bulletin list from BBS with 1 click.

     APRS 7.5

     MacAPRS for Windows Beta 0.2.5

     Kantronics Pacterm.com (as a fall-back)

     I also use (for extremely portable use) a Sharp Wizard
electronic organizer as a "Dumb Terminal."  It may not be
the most versatile (TNC's in Terminal Mode, NO SOFTWARE!,)
but the whole packet station (TNC, H-T, roll-up J-pole & the
Wizard) weighs in at UNDER THREE POUNDS, AND IS TOTALLY
PORTABLE (hence the alias TPPSBX, or Totally Portable Packet
Station, Bronx.)

I'd wager the people who work emergencies don't think it a toy. Picture
the ease of tracking small boats in a flooded area as they look for
stranded people and animals and can't see the ground to tell where they are.

Or ask the US forces in Bosnia who have ordered a system to monitor
border patrols and markers (based on APRS technology).

>From one perspective, all of ham radio consists of playing with toys. But
some good comes of it.

OK...try this...a station in Alabama gets a doppler of +250Hz, a station
in Colorado also gets +250Hz and a station in Miami gets -100Hz. The sat
must be moving towards the first two and away from the third. A little
advanced math would tell you the exact angle and speed. Using the time of
arrival of the signal (yes, the receivers must be well synchronized)
would give the position.

>My guess is that no single pass occurance would be useful to fully
>characterize an unknown object.  The elapsed times of passage of a single

>to identify eccentricity, argument of perigee, inclination, or the
>ascending node.
>
No, the form of kep elements we use is actually crunched down from
vectors. If you have an exact time, position in three dimensions, and
speed vectors in three dimensions, you have the precise orbit. There are
programs that convert between these two formats. Look at the keps NASA
releases on SpaceLink for the shuttle. They provide them in both formats.
The vector format is especially helpful for controlled objects...fire a
thruster, and you just have to add the delta v to the vector elements at
the time of firing.

Hams use the form we do largely for historic reasons. With them, it is
possible to manually determine satellite pass info. Vectors must be
figured with computers, and when AMSAT started, no ham had their own
computer. AMSAT has a pubication of figuring orbits without computers.
Try it by hand sometime if you want a hint of the complexity of orbital
mechanics...and develop a real appreciation for your computer!

Don't know about the rest of you but so far this "toy" has;

Tracked multi marine mobile USCGAUX small craft on both routine patrol and
dedicated SAR evolutions here on Lake MI...

Allowed Illinois Wing CAP to run several ground/air search teams, in real
time, with digital comms freeing voice from un-needed excess traffic...

Allowed me to get current local WX info at a glance...

Will soon ( come on Agrello ) provide instant DFing to USCGAUX units at
Station Cal Harbour, Station Wilmette and Aux Facility Waukegan. In the cold
waters off Chicago seconds count, this toy is going to save a life!!

Changed the way we think about packet radio, face it prior at APRS most 1200
baud 2 meter packet was "whats for sale or allusa messages", don't think
APRS has had an impact? Notice all the TNC's with GPS support on the box?...

But I think the most positive thing this simple program has done is to open
up our minds about what we can do with existing hardware, made us THINK, not
just talk into a mike, pound brass or whatever. I've learned more reading
```

some of the messages on this sig than from any other mode of communication
in our hobby.

Also what's wrong with having fun?

Bill:

Re: Franklin Tennessee Digi KF4AJO-1.
    EER-5 Huntsville.
    North of Nashville APRS activity.

I haven't been regularly seeing your digi (-5) in the Nashville area. I do, on occasion, do see your home station but I don't remember if I see -5 at the same time. I'll start watching more closely. Hopefully the new station AJO-1 will help although it's just 10 watts now. You will soon see the Williamson County EMS Station and the directors Jeep roaming the county. We need a volunteer Ham in Williamson County to get involved with this APRS project.

We see nothing North of Nashville other than KC4WPS-3 in Gallatin. I do hear that there was some activity in S. Kentucky berore my time.

We have just arranged for tower space in Clarksville. We have a 60 W station about ready to go there but need more time and warm weather. I think Clarksville will, perhaps, link us into Paducah, Ky and cover some of the Land Between the Lakes area and up I-24.

KQ4TV gave me a copy of some more detailed maps (gratefully made by N4QEA) of the Nashville area but I have been unable to make them work or get the maplist right, or something, wana Help?

Hmm... At first blush that sounds like US forces ordered APRS, but then
you really didn't say that; just that they ordered, "...a system...based
on APRS technology..." Did they use APRS as Smitty was asking about?

Anyway, ham radio is fun.

OK guys. Here might be an answer for you. I think, and will give you an
address for confirmation, that the fence is only to key the phase shift
radar on location and time of occurance to track object. Like a warning
beacon. The AF uses a very large phase shift radar to track the space
objects - junk as well as satellites. Lloyd C. Wood <woodl@cybertron.com>.
Woody works for AF at Eglin AFB where the big radar lives.

Please excuse the bandwidth if this has been previously covered
in detail. Please also respond in direct email as I do not
receive the SIG. This is in regards to the USGS 1:2,000,000
CD-ROM dated 7/95 which does not appear to be in the same format
as the older versions. I had heard that the old programs would
not work correctly on this ROM. If anyone knows the steps needed
to make useful APRS maps from this disk, I would appreciate
hearing about them. If there are any special programs required,
I would appreciate their exact filename for FTP and their
location if not on the TAPR site.
Thanks in advance.

WB4APR REPLY COMMENT: Anyone in PA wanna help put these maps together?

---------- Forwarded message ----------
Date: Tue, 12 Mar 1996 19:28:21 -0500
From: Bernie A <berlyn@epix.net>
To: bruninga@nadn.navy.mil
Subject: NE PA Maps

Hi Bob,
        A while ago I started to make some maps of northeast PA. I have
about 25 to 30 made. Unfortunatly, working 2 jobs and going to school I

just don't have the time to pull things together. I made them using the USGS maps I got from the Internet. I did not put any labels on them nor did I stack them for APRS. However I did create them in an orderly fashion and kept good documentation. If you or anyone else is interested in having the maps, I would be happy to send them to you/them for completion and arranging.

Thanks Bob.....Bernie WM3L berlyn@epix.net

369. Unproto path bug

From: Richard Amirault <amirault@laraby.tiac.net>
Date: Tue, 12 Mar 1996 23:05:56 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.BSF.3.91.960312225720.14129A-100000@laraby.tiac.net>
Rendered body type: text/plain

I recently upgraded from 6.8a to 7.5

I posted a msg regarding the problem that I was having with unproto paths taken from the 'saved' list not working properly while a manually entered path (with the "U" command) works just fine. I did not recieve much help from the sig with this problem when I posted my first msg.

I have further info that convinces me that there is a bug in the program.

Tonight I happened to notice that the manually entered path, when viewed with the TAB key, had a *lowercase* "via", while a path taken from the 'saved list' had an *uppercase* "VIA". Entering a path to the saved list in lowercase always get save as uppercase.

I went to the config file and with an editor changed a couple of the paths in the saved list to lowercase "via". Now those paths work every time!

Bob, please check this out!

No - they use a system **based on** APRS. So - the answer to the question
is "Yes. One practical use for APRS is to use it as a base to develop associated
technologies, like those in use in Bosnia by U.S. forces." This happens in software
development all the time, and it is **definitely** a practical use. In other words,
there are practical uses for APRS other than running the APRS program and hooking
your computer up to a GPS, TNC and antenna. Now do you understand?

I am reminded of the report that when Faraday (or was it Oersted?) was
first demonstrating the transmission of radio waves across a room,
a woman reporter asked, "Yes, this is all a nice demonstration, but what
good is it?  All it appears to do is consume resources and generate
noise."  The esteemed scientist responded, "Madam, what good is a
newborn baby?  All it appears to do is consume resources and generate
noise, too."

I'm not an APRS operator, but I have been mildly entertained by the
Bob&Phil show recently.  Fortunately, I cull the mail before I let it
get to my students.  I don't like to dampen enthusiasm for the hobby too
early.        :)

While there was indeed lotsa useful info in that message, it is of interest to
those who can afford a Garmin only!  Congrats to the clown that uploaded that!
he just qualified for the Guiness Book of Records for the LONGEST MESSAGE
EVER!  Some of us DO have limited hard disk space, you know!  Actually I want
to print it out incase I hit the lottery and can buy a Garmin, but it will take
nearly a case of paper!  Gotta find a word processor that will inport a file
that long too.  Please, guys, don't put any messages longer than a pa[Dge on
here!73, Pat
/?

382. APRS75a comming soon

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 13 Mar 1996 11:39:25 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960313113521.9889A-100000@greatlakes>
Rendered body type: text/plain

```
Here is what will be in 75a.  Have I forgotten anything that I promised to
fix (that is relatively easy...)  Otherwise, I hope to post it by Friday...

Ver 75a:
*** Moved all MAPLISTS to a new directory MAPLISTS to unclutter the
    APRS directory. I suggest keeping a copy of MAPLIST.USA in the APRS
    directory so you can still run old versions of APRS if needed.
*** New GATE rules:  Every GATE operator must put B E 0/10 instead of
    B E 0 in their INITTAPR.TNC file so they beacon on VHF if operating
on HF
* New GATE symbol looks like a gate
* Truck symbol is now a pickup. "u" becomes an 18 wheeler
* WX-DispWX and WX-ShowTemp commands show WX vice CALLS on map.  See WX.txt
* During REPLAY, FILEname is retained for subsequent use
* Fixed DF vehicle heading
* WX-JustWX command now toggles ON until toggled OFF
* alt-SETUP-OTHER-REDRAW command toggles on an auto-redraw function.  The
  map will be redrawn every time your station Beacons.  This to keep the
  screen fresh for un-attended displays
* New CFIG75.APR file.  You can update your old CFIG73x file by adding
  3 new items to the line after RELAY near the end of the file so that
  it becomes 0,0,0,0 and then rename the file to CFIG75.APR
* New TORCHw, TORCHm, and TORCHe.bk files for olympic torch route
* Updated DIGIwest and DIGIeast.bk files
* SPRE.HST file shows the results of the APRS posits via SPRE satellite
```

Rendered body type: text/plain

Re: Bob Hartman's question about the 1:2,000,000 disks

Calm down- Jim, (UOG). Don't be so quick to condemn him!

I recall seeing messages here that the format changed on the 1:2,000,000 CD.
I recall that "optional" format may not be the type that is compatible with
our tools for making the 32 mile maps now. Gerry Creager was checking with/
complaining to USGS on it, I think.

I think Bob has run into this problem and I don't think anyone has solved it
yet so how can he RTFM?

This is the reason I have been holding off on my own 1:2,000,000 Disk. I
think the 100,000 : 1 disks are still ok.

Also, he asked that you respond via Email. Said he didnt read the SIG.

To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960313083242.22802B-100000@crl7.crl.com>
Rendered body type: text/plain

WOW! Lots of info on APRS.

Actually, my original email was meant to be a private email, however,
afterwards I noticed that I had accidently sent copies to both the amsat-bb
list well as the aprssig list. And, I am not even subscribed to the
aprssig list yet :-)

So I apologize if I raised some hackles with the "toy" reference.

Anyway, I appreciate all of the very FB information about APRS and it's uses.

As you might have surmised, I am not a packeteer, but I am interested in
getting back into satellite chasing. So, I am now interested in some of
the digital modes that are being used.

So, thanks for the information. As I said before, I am not subscribed to
the aprrsig list so I am trusting that this email will get on the list.
Since I am not copying the amsat-bb list on this email, you may email any
further info directly to me if you wish, otherwise I won't see it.

CUL,

Smitty, NA5K

>
>        -Jack

N9QGS REPLY:

I think what you want to do is, open your map, load your track history file,
let it run through it then click on object change it to a dot, go under
display options and don't display call, and then clear screen again, and
click on jeep and hit the (R)eplay function and it should be all dots.  Hope
this helps

ME
   I DID!!

I had my Sacramento to Rochester Train trip back before Christmas. I had my
```

GPS-45, Pico Packet TNC, FT-470, and laptop computer running the whole way.
I saw stations in Ca, Co, and around Chicago. I know of one station outside
of Denver that saw my posit. I was at a disavantage of not being able to
have outside antennas, I hope Rich can have outside ants!!!

I talked to Rich just before my trip left for my trip. I was hoping that he
was to be on my train, but he doesn't do that route. I was wishing for a
contact at the front of the train!

Randy

     Its great that the APRS program is progressing so well. However I am
concerned about the problem of keeping the text files updated. It would be an
onerous task if it was necessary to print them all out after each
update. I have to admit that I haven't checked to ascertain whether in
fact that would be necessary. However, judging from the remarks in the
SIG,it would seem to be so.

I would like to remind the group that you can have both a newsgroup and an
E-Mail echo of that group. I don't think this group is big enough for a
mainline rec.xxxxx group but the alt.xxx groups were created for just this
purpose. Also it is much easier to establish an alt. group. The big problem
with this mail server is the [APRSSIG:xxxx] in the subject line which
prevents my mail reader (Eudora Pro) from sorting the messages by thread. It
would save me time everyday if this group would go to an alt. newsgroup. I
vote yes.

Barbara  KK6IB

WB4APR REPLY COMMENT:  I go to great lengths to update ALL AFFECTED text
files with each new release.  In each new release, the UPDATE version
contains new copies of only those TEXT files that have changed.  ALso
if there are significant changes, then I highlight that in the
NEWNOTES.txt file which comes with all upgrade versions.  Your TEXT files
are automatically UPDATED whenever you upgrade to a new version.  If you
want to PRINT the new files, then ONLY print the TEXT files in the UPGRADE..
```

397. News Group vs Mail Reflector

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Wed, 13 Mar 96 18:36:33 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.4.826760193.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

The APRSSIG is currently done as a MAIL list. The responses to this question have been varied...

Currently, I don't see any major reason to move it to a News Group, especially since they are somewhat more subject to SPAMming than a news reflector..

On the other hand, if we DO decide to go to a newsgroup, I will go thru the proper channels to get it set up as rec.radio.digital.aprs

At the moment, due to the comments, both on the SIG and personal, I think it should stay as a mail list for the moment..

Another comment, Please do NOT!! send enclosures to the SIG, it can cause major problems for some of the different mail programs in use..

If you have a large file that is of interest to the group, upload it to TAPR and send a notice about it to the SIG..

Keith

398. Sharp Wizard "Terminal"

From: Arthur Booten <N2ZRC@gnn.com>
Date: Wed, 13 Mar 1996 18:56:43
To: APRSSIG@tapr.org
Message-ID: <199603132357.SAA05924@gnn-2.gnn.com>
Rendered body type: text/plain

I got several requests for info about my "Totally Portable Packet Station" setup so rather than answer them all separately I figured there might be more people interested in it that have not (yet) asked.

It seems any 8000 or 9000 series Sharp Wizard Organizer that has the proprietary 15-pin connector can be used as long as it has a terminal mode. Sharp sells an RS-232 level converter that's about 1 x 2 x 6 inches, has a standard 25-pin female jack on one end, a 6 foot cord with the proprietary 15-pin plug on the end and a coaxial jack for 6 V dc.

I stuck a piece of velcro on the bottom of the thing, another on top of the KPC-3 which has a 9 V "transistor" battery installed. For the 6 V the level converter needs I got a 4-AA battery holder from Radio Shack, made a short wire from it to the right size DC coax jack (I forget what size) and used a few more pieces of velcro on it and the KPC-3. Add a VERY short (6 inches is enough) 25-pin plug to 25-pin plug and VOILA!

As far as settings go, I use 9600 8-N-1 between the TNC and Wizard. Unfortunately, while the Model 9600-II Wizard I use will support 80-character lines, you have to scroll left and right in order to see it. The screen (without scrolling) is 62 characters wide, so you have to tell this to the TNC. The down side of this is you get a whole line, then the "rest" of the line. It looks kinda funny but you get used to it. I also should say that if you have bad eyes or fat fingers this setup probably won't to be to your liking.

Believe it or not, this setup is how I first got onto packet. I'd NEVER owned a computer at that point and did just fine with it for over a year. In fact, during CQ magazine's CQ 50 celebration I made over a hundred contacts with this contraption! No hard-to-configure software, no pesky port conflicts. Not much versatility either but what do you want...a 900 GHz super-ultra-pentium-pro that fits in a shirtpocket? Intel don't play dat! But for sheer portability and bang for your buck? Suuuuuuuuuuuuuuuuuuuuure! 73 all.

Arte Booten <N2ZRC@gnn.com> or <N2ZRC@aol.com>

They changed the format and HAVEN'T published a standard yet. They talk the
standard to death on their associated web sites, but there's nothing that
identifies the file structure that I can find a link to. I still have a
little more complaining to do! :-)

> This is the reason I have been holding off on my own 1:2,000,000 Disk.   I

And tests notwithstanding, one set of datapoints do not a conclusion make
(regards using a 1/4 wave). There's a reason Garmin's first non-amplified

antenns on the GPS-50 and -55, and -95 (espeically aviation applications, but
others apply) used quadrifilar helices.

Knock yourself out. You'll do better with a patch approximating resonance
over a ground plane.

>   2. Knowing that the diameter of the antenna element effects
>   the Q and bandwidth, what the heck have I done? Is this
>   antenna really horizontal or is it a very broad band, but
>   short, vertical? Or, is it just a hunk of metal that works?

shooting in the blind here, without resorting to some of the design tools, but
I believe you've come up with an approximation of a very broadband vertical,
with a small half-cone of obscuration. I'd have expected the patch to be
somewhat smaller, but you could be seeing coupling effects, etc., from the
materials already in use.

>   3. Without matching sections what is the impedance of a
>   center fed pizza pan that may approximate a 1/2 wave or full
>   wave at 1500 MHz. Or, does it matter with the GPS-45?

Well, it's almost certainly a 50-ohm circuit. It does matter somewhat. I'm
not even gonna hazard a guess here, without digging out the tools. And that's
going to take some doing, these days.

>   4. What about amplifiers? I don't see why one of the
>   little 20db modules wouldn't work. or perhaps a good FET,
>   any ideas?

They should, but since you're getting good results, why?

>   I have now made three of these little "things" and they all

>   like a taxi.

Consider it "local color".

>   I am only posting this because Kieth has chewed us all out
>   about flames and I feel safe.

Your results are interesting and thought provoking. There's nothing wrong
with a little experimentation. I'd suggest you borrow a PVT-6 and use Bob's
program to compare results.

>If you want to PRINT the new files, then ONLY print the TEXT files in the
UPGRADE..
>
>
I find that keeping a directory, alpha sorted (DIR /ON) at the front of my
documentation helps. When I update to a new version I print another alpha
sorted directoey of the Docs then print any where the date of the doc has
changed from the old printout. Another way to do this is to do a date
sorted (DIR /OD) command and only print the files that have changed since
your last download. A bit time consuming but well worth the effort.

RE: the Enclosures that Keith spoke about in the previous message I agree. I
often crash when I read the messages with the attached files or crash when I try
to delete the message without even reading it.

Users with Microsoft Mail that are using it to post messages please beware of
this problem. Another sig member noticed this after repeated attachments (every
sig posting he did!) and found that Microsoft has done this intentionally to
proide other Microsoft users a alternative to read the message (Word I believe).
There is a way to shut it off but I do know the command.

Please look into this, it can become quite annoying to reboot every time we try
to delete the message. Darn that Microsoft!

I just posted PAmaps02.zip which now also has NORTH Newton Square.

I extracted the wrong QUAD, so only did the top half of the area
above 40.0000 degrees...

Using MK100Kv20 I have found that you should never use the .MAP results,
because the randomly thrown away points always result in meaningless
roads and intersection.  YOu must use MAPFIX on the .DAT files instead...

ALso, MK100V20 always crashes, because of a file name error, so I run it
under QB.exe  so that I can fix the error and let it continue.  It makes
1, 4 or 9 maps all at once...  Didnt KB4XF fix the file name problem in a
later version?  What is the name of that later version?
```

Bob in order to use the version you have, you have to enter an 8
character file name or it will crash everytime. Funny you have that
problem since i did also this morning making some maps, i had just forgot
about that problem so i looked on Tapr and found a later version that
doesn't have that problem and it's called MK100K2a.ZIP. This version
worked great trough a 9 mile grid of maps i did this morning. By the way
been playing with the new USGS 2,000.000 files in the new format and in
no way can i make those files work, sure hope they won't change all their
CD's to that format or we will be sunk.

>
>header "to" contains aprssig
>
>Ralph N4NEQ
>________
>
>

I use Eudora Pro and it works well. I filter this SIG into several categories. Everything from Bob goes into one mailbox. He repeats enough of the original message to make sense, and then answers the question. I don't need to read the rest.

Works like this:

```
        [HEADER]        To:
        [CONTAINS]      Aprssig
        [AND]
        [HEADER]        From:
        [CONTAINS]      Bruninga
        (X)TRANSFER TO: Bob Bruninga   (which I keep under Ham/Packet/APRS/BOB)
```

Next (IMPORTANT - filters must be in the order you want them filtered. It filters in order of the list.)

```
        [HEADER]        To:
        [CONTAINS]      Aprssig
        [AND]
        [HEADER]        <<ANY HEADER>>
        [CONTAINS]      MAP
        (X)TRANSFER TO: MAP   (which I keep under Ham/Packet/APRS/MAP)
```

Next

```
        [HEADER]        <<ANY HEADER>>
        [CONTAINS]      Aprssig
        [AND]           (ignore)
        [HEADER]        (blank)
        [CONTAINS]      (blank)
        (X)TRANSFER TO: Incomming   (which I keep under
Ham/Packet/APRS/incomming)
```

Incomming is my file for all other stuff that everyone writes. By placing it after the other 2 filters, it allows them to strip out the subjects that I want to be filed in another location and leaves the rest for review. This is a big file with all the chatter on this refelector. I can review it if there is something interesting in the SUBJECT line or if Bob mentions something that I might be interested in going back to check out. I dump this entire file about once a week.

Any questions, just e-mail me. I am not trying to sell Eudora, however our company does produce it. You can get information from the web site www/qualcomm.com or call 1(800) 4-Eudora.

Take another look and you will see that it sorted by APRSSIG message number
and not by the message subject. The [APRSSIG:XXXX] is the first thing Eudora
sees in the subject line so it sorts by that. You can't get rid of it by
using the filter either without losing the whole subject.

For some reason i got the message "Access PERMISSIN DENIED" for the
100K and the 2M DLG files on the USGS when attempting to download some of
those files. I didn't have no problem accessing none of the other
directories using FTP. Wonder if it's something i'm doing or USGS
changed something again.

Theresa, I am passing this message along to you so you won't
download this program. I don't think you would ever have need to do
it but be aware. Almost all zip files are for IBM machines.

Talk to you in the morning.

Love, Dad

427. WO-18 Posit Reporting (2)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 14 Mar 1996 21:35:12 -0500 (EST)

To: amsat-bb@amsat.org
Cc: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960314212320.9392A-100000@greatlakes>
Rendered body type: text/plain

```
Seeing this months QST article "The Road Less Traveled" about the under
utilization of the 1200 baud Pacsats and at the risk of inviting the
further wrath of Mr Chen, it seems to me that there is real potential
here via WO-18 for some serious experimentation with world wide
amateur mobile/portable position reporting.  Here's why:

  1) The UPLINK is 1200 baud FSK using only a 30 watt 2m FM radio!

  2) The antenna can be an OMNI 19 inch whip!

  3) A position report only takes ONE 1 second packet at
     a very low duty cycle.  Even at a rate of 1 a minute, this
     2% duty cycle could drive a 35 watt modular FM amp with NO
     HEAT SINK.. Meaning the 35 watt amp is the size of a MATCHBOX!

If you limited your uplinks to WO-18 passes only (4 per day for
10 minutes each) your total energy requirement would be 40 * 35 * 2 or
2800 Watt seconds (50% effeciency).  This is less than 1 Whr.  Eight
D cells could power this POSITION REPORTING device for several MONTHS!

Are there any Backpackers, DXpeditions, Rovers, RV'ers or SAIL boaters
listening?  The entire GPS receiver, TNC and XMTR could easily be built
into a Cracker Jack's box (plus batteries and 19 inch whip antenna)...
Remember this is WORLDWIDE coverage (but only 4 times a day..  Many
MORE at the poles).  Perfect for travelers on a multiple day expedition
far from conventional communications...

  OOPS, I forgot about the FSK modem for the TNC, but I ASSUME that
an FSK modem is simple to make for this TRANSMIT ONLY application...
Gwyn at PacComm, care to comment?  On the receive side, all we need
are a few RECEIVE sites per continent that would DIGI these PACSAT
POSITS onto the HF tracking frequency... (or the internet!)

Someone with PACSAT experience and MODEM experience want to elaborate on
the simplicity or complexity of the FSK modem for the uplink?

-- [ From: Kevin Kelly * EMC.Ver #2.5.03 ] --

Greetings SIG members:

Just received the surplus Maxon 2m transmitters offered by Mark Endicott in
a recent post.  The units are Very nicely packaged in metal enclosure with a
a db9 for the i/o and a bnc for the ant.  Looking forward to getting them
crystaled up for APRS trakers I'm building.  Just wanted to let the SIG know
that the transmitters are excellent quality at a good price.

73,
Kevin Kelly/N6QAB

Hope to meet you in Dayton.

```

Not sure if they will work, below is the Crystal specs;

Receiver Crystal:

```
XTAL Freq. = Operating Freq. - 10.7 MHz
             ---------------------------
                          3
TYPE.........3RD OVERTONE [44-MHz RANGE]
TOLERANCE.....003% cOMMERCIAL sTANDARD
TEMPERATURE...26-Degrees C [Room Temperature]
LOAD..........Series
CASE..........HC-25U or FM-2
```

Transmitter Crystal:

```
XTAL Freq. = Operating Freq.
             ---------------
                    8

TYPE .........Fundamental Mode [18-MHz range]
TOLERANCE......003% Commercial Standard
TEMPERATURE...26-Degrees  C [Room Temperature]
LOAD..........32 pF, Parallel
CASE..........HC-25U or FM-2
```

If you can use them let me know...Posted the specs on the SIG here in case
in anyone else can use them if you can't.

73 de Bill

431. Still fuzzy about UNPROTO

From: "Bruce W. Martin" <martinbw@telalink.net>
Date: Thu, 14 Mar 1996 22:56:32 -0600
To: aprssig@tapr.org
Message-ID: <9603142256.AA32998@oscar.telalink.net>
Rendered body type: text/plain

In spite of reading text files and owners manuals and other books on packet
I am still a little fuzzy on the working sof UNPROTO. My discussion with
others reveals that they are just as much in the dark about this subject as I.
I have come up with some scenarios and a series of questions that I hope can
shed some light on this subject and hopefully help others to understand how
this works. Your assistance in understanding this is appreciated.

Bruce, KQ4TV

Given:
All digis are WIDE-RELAY.
All point-to-point communications are are 2-way.
(K4QTH & AA4W can hear each other etc.)
There are other WIDE-RELAY digis beyond the known "fringe" digis that can
be communicated with.
There are other unknown home (RELAY) stations that can hear one or more of
the digis.

```
                                  # AA4NN

                                  # AA4N

 # AA4WW           # AA4W         + K4QTH         # AA4E           # AA4EE

                                  # AA4S

                                  # AA4SS
```

Scenario 1:

K4QTH, AA4W, AA4N AA4E, & AA4S can hear each other.
All digis can hear the digi next to them (AA4E can hear AA4EE and vice versa).
AA4W, AA4N AA4E, & AA4S can hear each other.

Questions:

1. What UNPROTO path should K4QTH use to give the widest
   disemination and least QRM.
2. What UNPROTO path should each digi use to give the widest
   disemination and least QRM.
3. K4QTH sends his position report with an UNPROTO of
   APRS VIA RELAY,AA4N,AA4E,AA4W,AA4S,WIDE.
   How is his report propogated?

Scenario 2:

K4QTH can hear and be heard by AA4W, AA4N AA4E, & AA4S.
All digis can hear the digi next to them (AA4E can hear AA4EE and vice versa).
AA4W can hear AA4N & AA4S, AA4E can hear AA4N & AA4S.
AA4S can hear AA4E & AA4W, AA4N can hear AA4E & AA4W.

Questions:

1. What UNPROTO path should K4QTH use to give the widest
   disemination and least QRM.
2. What UNPROTO path should each digi use to give the widest
   disemination and least QRM.
3. K4QTH sends his position report with an UNPROTO of
   APRS VIA RELAY,AA4N,AA4E,AA4W,AA4S,WIDE.
   How is his report propogated?

Scenario 3:

K4QTH can hear and be heard by AA4W, AA4N AA4E, & AA4S.
All digis can hear the digi next to them (AA4E can hear AA4EE and vice versa).
AA4W, AA4N AA4E, & AA4S cannot hear each other.

Questions:

1. What UNPROTO path should K4QTH use to give the widest
   disemination and least QRM.
2. What UNPROTO path should each digi use to give the widest
   disemination and least QRM.
3. K4QTH sends his position report with an UNPROTO of
   APRS VIA RELAY,AA4N,AA4E,AA4W,AA4S,WIDE.
   How is his report propogated?

Scenario Independant Questions:

If there are three other stations (K1QTH, K2QTH, K3QTH) between AA4W and AA4E
and every one from AA4W to AA4E can hear each other.
What happens when K4QTH beacons his position with an UNPROTO of RELAY?

What happens when K4QTH beacons his position with an UNPROTO of RELAY,WIDE?

K4QTH recieves a report as follows:
K9QTH>APRS,WIDE,WIDE*:?APRS?
What digis passed this report?

My standalone tracker in my car has an UNPROTO of RELAY,WIDE.
Why is does my position report:
KQ4TV-9>APRS,WIDE,RELAY:$GPGLL,3610.65,N,08635.22,W*76
have them reversed?

Gerry - please note question to you later in this message. Thanks.

Hi guys

I stumbled across this, and if you don't already know about it, you should!

A very neat site! (http://tycho.usno.navy.mil/time.html)

I especially recommend reading the "standard disclaimer" near the bottom of the page! Don't miss this!

The first yellow button "click-on" ....("What time is it?")....will take you directly to the page where you can access the "real-time" clock. Your WEB browser needs to be Netscape to see the "real time" clock (not corrected for network delays!).

In addition to a lot of information about the standard clocks, there is a lot of information about the GPS system.

The following paragraph is excerpted from:

UNITED STATED NAVAL OBSERVATORY (USNO)
AUTOMATED DATA SERVICE (ADS)
File GPSTT -- <960102.1351>
..
..
..
GPS TIME INFORMATION
Beginning June 17, 1990 at 0000 UT, GPS time is given by its Composite Clock (CC). The CC or "paper" clock consists of all Monitor Station and satellite operational frequency standards. The system was previously referenced to one of the Monitor Station's operational frequency standards and switched from one station to another as needed. The GPS epoch is 0000 UT (midnight) on January 6, 1980. GPS time is not adjusted and therefore is offset from UTC by an integer number of seconds, due to the insertion of leap seconds. The number remains constant until the next leap second occurs. The offset is also given in the navigation (NAV) message and your receiver applies the correction automatically. As of January 1, 1996, GPS time is ahead of UTC by eleven (11) seconds.
..
..
..
This evening I compared the time as shown on my Garmin GPS 45 with WWV. They are exactly the same as far as I could tell by eye - certainly nothing like the 11 second offset mentioned above. So - at least the GPS 45 does the automatic correction mentioned above. I wonder if ALL the GPS receivers really do that?

Question to Gerry. Why does the GPS system carry this offset, instead of correcting its time to be the same as the USNO standard? Deliberately carrying this error and then requiring the receivers to correct for it seems a rather convoluted way of doing things. Please keep educating us from your experience with the GPS system!

Sent: Wednesday, March 13, 1996 2:58 PM
To: aprssig@tapr.org
Subject: [APRSSIG:7555] Re: News Group vs Mail Reflector

RE: the Enclosures that Keith spoke about in the previous message I agree. I
often crash when I read the messages with the attached files or crash when I try
to delete the message without even reading it.

Users with Microsoft Mail that are using it to post messages please beware of
this problem. Another sig member noticed this after repeated attachments (every
sig posting he did!) and found that Microsoft has done this intentionally to
proide other Microsoft users a alternative to read the message (Word I believe).
There is a way to shut it off but I do know the command.

Please look into this, it can become quite annoying to reboot every time we try
to delete the message. Darn that Microsoft!

Subject: [APRSSIG:7577] Re: >->->->->VIRUS ALERT!<-<-<-<-<

Theresa, I am passing this message along to you so you won't
download this program. I don't think you would ever have need to do
it but be aware. Almost all zip files are for IBM machines.

Talk to you in the morning.

Love, Dad

435. Help, need GPS suggestions

From: Roger Sellers <rsellers@misha.net>
Date: Fri, 15 Mar 1996 00:23:06 -0600
To: "'aprssig@tapr.org'" <aprssig@tapr.org>
Message-ID: <01BB1205.9ADF9120@dial05.misha.net>
Rendered body type: text/plain

I'm relatively new to ham radio (6months) and the APRS stuff has captured my interest and
attention. I was able to get the WinAPRS up and running right after it was made available. I have
something on my PC that makes it want to crash (using Win95) but that's another issue entirely.
Anyway, I used to only have a HT and was switching back and forth between voice and using it
for APRS. I just baught an ICOM IC2000h at a hamfest and was setting out to build a portable
system using my trusty old '286 laptop. I will be limited to using the DOS APRS because of only
one com port on the laptop (mouse and TNC wont share nicely!). I got Windows to run on it, but
the TNC had a fit.

```
  Ok, so here goes, I got my 286 running off 12 volts, a KPC3, and the ICOM 2000 working together
now. I want to add a GPS unit. But, I really don't know the first thing about them other than the way
they are supposed to work. It sould as though there are a number of users here that have GPS's.
  Could I solicit some advice,comments, 2 cents worth, etc.. to help me make a wiser decision
on what make/model is better to use. I will assume others will also be interested in this kind of
advice. Here in Northern Illinois, our local area has a fair concentration of APRS users (all versions)
and I know there are several others here planning to make future purchases. I have been monitoring
the messages here for a while and have'nt seen much discussion along these lines. This may be
an old and frequent discussion here, but with so many new people getting into APRS, this is
continually useful to others like me.

  If you have an opinion or suggestion for a GPS unit of preference, I'd be interested. Also, info on
where
to purchase and $$ might be of help. There are no dealers close to me as far as I know of.
Thanks in advance,

Roger Sellers

> trouble deciding what to read/archive and what to just blow away.

The thing is, I -have- to sort through my Email if I'm to make sure I
don't miss an important message or one I don't want to miss.  There are
threaded Email readers and there are mail processing (filter) programs,
but most news readers have these features built-in.  If I'm not
interested in a thread, I hit ^K (or whatever) and I never see an article
with that subject again.  If I get tired of someone, I can do the same
with them.  I can also have articles of particular interest to me
automatically highlighted (sort of a reverse kill -- again, these features
are built-in to most news-readers I've seen).

What's more, I can read APRS-related stuff when *I* want to, not every
time I want to check my Email.

Thus, I'm in favor of creating an APRS newsgroup, with the ability to
"mirror" it to a listserver for those who prefer the Email method.  I
can't imagine making it a newsgroup will add more garbage to it than
is already in this listserv topic!

Optionally, in addition to having a newsgroup, we could turn the APRSSIG
into a moderated list, so at least the flames and accidental "private"
replies are filtered out for the rest of us.

A year a go I was in the same position. After soliciting opinions and reading as much as I could find I ecided to buy a Garmin GPS45. It is a nice small unit with sufficient features and available at a reasonable cost. It has a removable antenna that can be remoted or an external antenna can be substituted. I also found it to be quite easy to interface to my computer and to my TNC (KPC3) to work as a standalone tracker. I have had a problem with my unit. Most days I park my car (equiped with a GPS45 and an APRS standalone tracker) in the garage and turn off my tracker. In the morning when turning on the tracker the GPS45 I has dropped from Normal to Sky Search. I have called Garmen and they have told me to send it in for warranty repair. I plan to do that next week. I purchased my unit from E&B Discount Marine (1-800-BOATING)(1-800-262-8464). I recommend getting the mounting bracket and the Power/Data cable. I purchased mine a year ago for about $335 including the bracket and cable.
I know others on the SIG like the Magellan units and recently there are several people that may tell you about the Eagle AccuNav Sport.

I hope this helps,

Roger,
First, all of your messages to the list have an attachment to them (at least on my computer). It must be unintentional. You may wish to look into it.

Second, the single port/GPS theme has been addressed in the /readme docs, so I think you may find some help there. If the need for an HSP switch comes up (that allows use of a TNC and GPS on the same port) I have one that I bought for Wx that evidently wont work for that function. I paid around $25 for it. I'll sell it to you for less.

Also, N9WMM in the Chicago area just bought a Garmin 45 from E&B Marine for about $270. I have their phone no, so you can get a catalog from them if you want. Let me know if you want it.

I live down the road in DeKalb.

To: Roger Sellers, KB9LBU
    Roger, I also have a Garmin GPS 45 and have been pleased with it. It works fine for a stand alone tracker and is a fun instrument to add to the instrument cluster in the car. I got mine last summer from West Marine here in Dallas, although West Marine is a nationwide outfit. It cost $299. I also

```
bought the mounting bracket and the power/data cable, together cost an extra
$65. That's kinda steep for such items, but they work well and there is
minimum hassle about putting it all together. As Bruce said in his reply to
you, there are certainly other good units on the market, but I don't think
you will be unhappy with the GPS 45 if you decide to go that route.

To: Bruce Martin, KQ4TV
    Bruce, re your problem with the GPS going into Sky Search mode. I also
have experienced this when I parked the car in an undergound garage and left
the GPS 45 powered up. When I came back to the car, the GPS 45 was in a
power off state, and needed a Sky Search to get going again. However, this
does not happen if I remember to power down the GPS 45 when I park the car
where it cannot see the sky. Then, when back outside, a power up and the
unit usually reacquires lock on the birds in 10 to 20 seconds.

You say you turn off the tracker when you park in the garage. Does this mean
that you actually hit the on/off button on the GPS 45, or just drop the
external 12 v power? Just dropping the external 12 v power does not turn the
GPS 45 off (if you have the 4 AA cells installed internally as Garmin
recommends). When I make sure to turn off the GPS 45 with its front panel
switch, I do not have the Sky Search problem. Maybe that would work for you,
too.
    73 to all

```
Last week, I talked to Roger Jacobs at M/A-Com.  He's the product manager for
their active and passive antenna line.  He tells me they *will*  sell small
quantities to the public and especially to hams.

If your local M/A-Com sales rep won't sell to you in qty-1 (They work on
commission, and Roger says sometimes they may try to avoid the small sales),
he says to call the factory and they will sell direct!

For Cows In Space, I used an ANC-C-109 patch antenna.  It's roughly 3 inches
in diameter, 3/8 inch tall and has an SMA connectoron the bottom.  In qty-25,
it cost $36.  I'd expect these _PASSIVE_ antennas to be about $45 in qty-1.
The ANP-A-114-4, a similar active antenna with about 24 dB of gain (I'm doing
*this* one from memory) is $80.25 qty-1, and it can be powered by +5 on the
coax.  The 114-4 uses a TNC connector, but they have other options.

M/A-Com has a catalog on diskette.  I'll port that to the tapr site next week
sometime.

> carrying this error and then requiring the receivers to correct for it seems
> a rather convoluted way of doing things. Please keep educating us from your
> experience with the GPS system!

Makes the record-ceeping somewhat easier. I suspect yoour GPS-45 has been told to report times in UTC, and if it's outputting NMEA sentences it should be outputting UTC rather than GPS time, simply to comply with the NMEA standards.

GPS time is based on the original time they started the system. Every year or so, the geeks that be in charge decide the earth's slowing down, and add a second. From their perspective, it's real easy to add 1 second to the entry in the Almanac that each space vehicle transmits as part of the GPS message to all receivers, and which all receivers use to rough-determine satellites in view in the absence of good ephemeris data from the individual birds. The book-keeping associated with updating all 4 primary ground stations, the myriad backup ground stations, all the PRNs, AnD the user community, if they were to merely tie it all to UTC, would make life real interesting, and a little less synchronized.

Keeping track of the GPS offset shouldn't be a big issue on the ground. The user, if using NMEA should never have to worry this issue (older Magellan owners beware). folks using the Motorola PVT-6 engine can tell the receiver what form to output in Motorola Binary mode, thus making it painless there, too.

Hope this answered the question.

remember the Windows 95 thing? A lot of folks foresook a real, debugged operating system and got Windows 95, operatingon the belief that it was new, innovative and different... Micro$oft included in the package a mailer that automatically MIME-encodes everything sent out so that it can easily be read by their mailer and Word 7.0, assuming that they were the only folks on the Internet that used mail.

A number of folks who use other operating systems and mail programs have to contend with the issue. Micro$oft is of the opintion that it not their problem and do not, apparently, have an easy solution to getting rid of the attachments (they even MIME-encode a simple plain-text message!) so the only practical solution for the Windows 98 user is to go get Eudora or one of the other _working_ mail programs.

Me? I'll stay with what *I* have to work with every day: Unix, as well as OS/2, which implemented a real 32-bit multitasking OS several years ago!

   >I'm in favor of creating an APRS newsgroup, with the ability to
   >"mirror" it to a listserver for those who prefer the Email method. I

>can't imagine making it a newsgroup will add more garbage to it than
>is already in this listserv topic!

Here's a better (IMHO) option: do what the emerg-l list and misc.emerg-services newsgroup have done - anything mailed to the emerg-l list is "automagically" posted to the newsgroup, so if anyone prefers Usenet, it's there for them. Dejanews is a great way to look up past postings, for example. However, postings to misc.emerg-services are *not* placed into the mailing list - so those who wish to read on-topic e-mail don't have to wade through spam. Then, moderate the mailing list if you must (*sigh*) but leave the newsgroup unmoderated. My prediction is that what happened with the mail list/newsgroup I mentioned will also happen to the APRSSIG - most of the traffic will be on the Usenet newsgroup, rather than the mailing list. This is because not only does the "spam" enter the system from Usenet, so does most of the useful discussion.

I certainly hope that this talk of "moderation" doesn't lead to the all-too-familiar "poison pill" of politics rearing its ugly head in APRS like it has in so many areas of ham radio. Most of the traffic on this mail list is, in fact, on-topic, and a *non-political* moderator would have to let it through. If the "moderator" is someone with a political axe to grind, this mailing list will quickly become a "politically correct mail only" list, which will serve nobody's interests except perhaps the moderator and his cronies. What will the "moderator" consider a flame and turn away? If a message is let through, someone feels insulted, and their reply *isn't* let through - the "moderator" has just taken a political position - "you can be insulted in a public forum, but you can't reply in the same forum because I said so." The last thing we need is a "zampolit" who turns away on-topic messages because he doesn't agree with the subject matter - there's a word for that, and it's *NOT* "moderation."

If anyone really cares (and can't figure it out from the above, ;-) I *strongly* oppose "moderation." It's too easy for a "moderator" to subtly change things to make it appear that political positions with which he agrees are universally accepted. I can easily see a "computer bigot" for example, only letting through messages slamming computers he doesn't like, and killing ones meekly pointing out that "they all have their strong points and their weak points." This is the kind of thing that IMNSHO *will* eventually happen here if this list becomes "moderated."

>Optionally, in addition to having a newsgroup, we could turn the APRSSIG

Rendered body type: text/plain

On Thu, 14 Mar 1996, Bruce W. Martin asked about using UNPROTO paths:

```
>
>                      DIGI-NN
>
>                      DIGI-N
>
>  DIGI-WW   DIGI-W    K4QTH     DIGI-E    DIGI-EE
>
>                      DIGI-S
>
>                      DIGI-SS
>
> Scenario 1:  The inner 5 stns can all hear each other
>    Q1:  What should K4QTH use for widest coverage?       A: WIDE,WIDE
>    Q2:  What should each digi use for widest coverage?   A: WIDE,WIDE
>    Q3:  K4QTH sends  VIA RELAY,DIGI-W,DIGI-N,DIGI-E,DIGI-S,WIDE
  ANSWER: Goes in a BIG circle!  4 local copies, and then DIGI-s sends
          it ONCE VIA WIDE for 4 more copies. Total is 9 packets, only
          2nd tier digi to repeat it is DIGI-SS.  Each packet was 28
          characters LONGER than if he had used WIDE,WIDE.
          If he used W,W then all 8 digis would repeat it ONCE and the
          inner ring *may* do it twice, but hopefully they all collide
          at the same time and only take up one time slot..
          NOTE: each digi takes up 7 BYTES even if the name is only 4!
>
> Scenario 2: The inner 5 stns all hear their neighbors, but NOT across
> the center.  IE DIGI-E does not hear DIGI-W
>    Same Questions:....           A:  SAME ANSWERS
>
> Scenario 3:  The inner 4 digis *cannot* hear each other.
>    Same Questions:....           A:  SAME ANSWERS
>
>
> Scenario 4: Add K1QTH, K2QTH, K3QTH to the center region between DIGIw/e
> QUESTN: K4QTH beacons VIA RELAY
  ANSWER: All 3 stns and 4 digis ALL digipeat it at once.  9 packets total.
          But, since everyone heard it in the first place, it gets through.
> QUESTN: K4QTH beacons VIA RELAY,WIDE
> ANSWER: Total BEDLAM. All 4 digis and ALL 3 stns digi the RELAY, then
          all 4 DIGIs digi the 8 resulting WIDEs, and the second tier also
          DIGIs it for a worst case of 1 + 8 + 8*8 = 73 packets
  NOTES:  1) Non-isolated stations should NOT use RELAY at the beginning
          2) If they all hear each other, then use NO DIGIPEATERS
          3) If they dont all hear each other, then use VIA WIDE
          4) if you want to go out to all DIGIs, use WIDE,WIDE
          5) NEVER use W,W,W.  With perfect collision avoidance, a total of
             1+4 + 4*4 + 16*8 = 149 packets (R,W,W is the SAME!)
> QUESTN: K4QTH recieves this packet:   K9QTH>APRS,WIDE,WIDE*:?APRS?
>         What digis passed this report?
> ANSWER: Knobody knows, He probably got it LOTS of times too
>
> My tracker is via RELAY,WIDE.  Why are they reversed in my packet?:
>         KQ4TV-9>APRS,WIDE,RELAY:$GPGLL,3610.65,N,08635.22,W*76
  ANSWER:  Good question???

Microsoft's Win95 mailer has decided that everyone would also like an
RTF-formatted version of the email that unfortunate Win95 users send.
Since it is not 7-bit ascii, it is sent as a MIME attachment.  The default
can be changed, I've heard.

"Windows 95: 19 million beta testers and counting"

APRS:

What is the minimum resolution that APRS can show?  I admit to not having
installed APRS yet and should probably just RTFM ... :-)

Could one display, say, a 1*1 square mile area and show vehicle movement?
I assume one can just take the roads layer of the USGS files and blow it
up to what ever one needs ...

I had a similar problem with my Garmin 45. (It also had another annoying
feature regarding spontaneous 1 minute arrival warnings) I complained to
Garmin, and since it was still under the 1 year warranty I sent it back.
They returned a completely new unit with a MUCH more updated software
version. All problems are now gone! All I had to pay was shipping.

Message-ID: <67@w6dnt.ampr.org>
Rendered body type: text/plain

```
The GPS system illustrated in Popular Science can land a jumbo jet by
category III (hands-off, completely automatic landing.)

FAA made 160 successful landings out of 161 in California. One of them was a
satellite kaput; plane did a go-around.)  [Apr 1996 Popular Science.]

Does anyone know how the system work? I'd like to know.

According to the diagram, they seem to have 2 transponders near the airport.
(which they called transceivers.) As well as a Differential transmitter
mounted at the tower.

I'd appreciate if someone can give me some detail of the set up, as the
article in the Poplar Science magazine (Apr.'96) is pretty short and vague.

WB4APR asked:

> Someone with PACSAT experience and MODEM experience want to elaborate on
> the simplicity or complexity of the FSK modem for the uplink?

First, the uplink is "MO" only, no "DEM" required.

The WO-18 uplink is IDENTICAL to AO-16 and LUSAT. The modulation used
is 1200 BPS with Manchester encoding. Here is the recipe:
  a. From your TNC extract the raw HDLC data bits at 1200 BPS
  b. Also extract from the TNC a 1200 Hz, 50% duty cycle clock signal
     synchronized with the data bits. Or if the clock is not available,
     it's pretty simple to lock a clock to the raw bits -- it can be
     done with as little as a 555 multivibrator.
  c. Take the 1200 BPS data and the 1200 Hz clock and feed them into
     an exclusive-or gate. This generates a phase reversal midway thru
     the bit.
  d. Low-pass filter this composite signal to ~2 kHz bandwidth. A
     simple RC filter with the RC product ~ 500 usec should be about
     right.
  e. Feed this signal into the FM input on the radio. Set the radio's
     deviation to about 2-2.5 kHz (probably less than it is running now).
  f. Packet away.

73, Tom

If anyone has recently purchased a USGS DLG Optional Format 1:2,000,000
CD-ROM Mastered 7/95 and finds that the traditional APRS mapmaking programs
cannot extract data from it, I may be able to help.

I have created a pair of linked QBASIC programs from programs written by
N7JXS, KB4XF, W7KKE, WB4APR, and others to specifically handle this new
format. They are not graceful, nor efficient, nor bug free ... but they are
the only programs I know of that can presently handle this new CD.

Please, if any flamers (or others) want to jump in and VOLUNTEER to create
or modify another program to do this FEEL FREE.

Until that happens, please contact me via DIRECT email (no need to clutter
the SIG) and supply an address to which I can send you copies of the
programs. -THESE WILL NOT WORK ON THE OLDER FORMAT 1:2,000,000 CD-ROMs, so
I prefer not to upload them to an FTP site unless a greater need develops
(they are NOT works of art).

Date: Fri, 15 Mar 96 17:30 EST
To: aprssig <aprssig@tapr.org>
Message-ID: <74960315223047/0004818186NA3EM@MCIMAIL.COM>
Rendered body type: text/plain

We just received our unit from Peet Brothers and initial tests have
proved most rewarding.

When this unit is installed and connected to the DB-25 of the KPC-3
at the DIGI site will it override the DIGI?

Can the Wx Station and a WIDE Digi peacefully coexist together or
is it an either or situation.

Both can co-exist without any problems. When I'm not in the Keys I leave
my KPC on transmitting the data (and as a WIDE), you've probably seen
some of the data, starts with '!!' and then a bunch of numbers. The only
problem now is that MacAPRS and WinAPRS can't decode the data from a
stand-alone U-2000. They do fine on the U-II. I have been "encouraging"
Keith to get that feature into the program, hopefully won't be too long.
I don't know if the DOS version decodes the data.

```
Sorry about the attachments. I didnt even know they existed or were a problem.
I've received several DIRECT and Pointed messages about this, somewhat shy of rude.

  I've sent e-mail directly to others for some time, I even belong to another SIG
and have not seen or received a single comment or statements about attachments.

  I would be very happy to comply with the requests and will try to find out how
to correct it. Maybe some enlighted soul would be slower to complain and quicker
to offer a newbie to the SIG exactly how to turn it off. Till then, I will endevor to
correct the situation.
  As a coordinator, I've seen a number of posts by you. Maybe a notice or bulletin
periodically could be posted with directions of how/where to check would be in order.
It would be great to see advice posted nearly as faat as criticism is. Not every
user of Windows 95 is technically privy to the way that MS has defaults configured.

You learn to walk by falling down, you learn the correct way things are done by
mistakes, or can accept wisdom by being offered the solutions before you make the
mistakes. Are you and others so quick to condemn the mistakes of a newer ham
and chew them out when they started in amataur radio? I hope not. So in  that
logic, I hope you and others will have a bit of tolerance. I don't mind being told I have
made a mistake or am not doing something right. But some of you guys need to remember
a bit of etiquite. I'd wish to expect more from ham radio operators.

WB4APR REPLY COMMENT:  Both functions will work perfectly.  Its tricky
for me to figure out when to paint it blue, green, or partial green, but
except for the colors, it will FUNCTION...   We may have some tweaking
of my code anyway to make the MAP display make sense all the time.  The
WX will always work, its just can I paint it green instead of blue...

ANYONE running a Ultimeter 500 with APRS or anything else?
Dont seem to get any data out of the ultimeter to the computer. I have their
interface cable which is a phone line to DB-9 serial connector.
I tried just a plain boot disk with no auto.bat or config.sys and tried
running Pro Comm Plus as the Peet Bros suggested with no luck. They said
data will just flow on the screen. Yes I held the 2 keys down for constant
data flow. Tried diff comm ports at 2400 baud.
Peet bros even exchanged my key board and spent quite some time on the phone
as we both worked side by side with an ohm meter checking the connection
between the keypad and the end of the DB-9. All is ok.
They want to send me another key-pad but I dont think 2 of them could be
bad. Dont know what else to suspect. ANYONE have the 500? Would like to hear
from you. I think I have exhausted any leads from the helpful Peet Bros.
Love the unit but also would like to get data flowing.

467. WO-18 digipeater for APRS

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 15 Mar 1996 22:12:38 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960315215641.26059B-100000@greatlakes>
Rendered body type: text/plain

```
THings are exciting!  Here is a summary:
1) Looks like we have Weber OK for playing APRS on WO-18!  See below...
2) Tom Clark says it only takes an XOR gate at the right place in your
   TNC and a simple RC filter for the audio to XMT!
3) I borrowed a PSK modem and on my first pass copied 50 packets of
   PHOTO-8.  Its all giberish on PROCOMM, but the packets are just
   normal ole AX.25 packets with headers and all.  The telemetry and
   STATUS packets are human readaable
4) Saw no digipeated packets.  Interface to the radio for XMT was MIC
   audio, and on UHF downlink was speaker audio. (I had forgotten how
   easy it was (except for the $300 modem, hi hi)
5) I tried to XMT, but missed half the pass due to tunAng innexperience..
```

but have only BEGUN. I only got the audio cables
wired up 3 minutes before the pass, Had never heard the PSK signal
before, and my KEPS were 3 months old, but the bird was RIGHT ON SCHEDULE!
6) Freq for downlink was 437.102 SSB
Freq for uplink was 145.900 FM (manchester encoded)

Since the XMT side is so easy, Im beginning to think that the receive side is also very easy too... Except for the modem, remeber that all you need is a UHF downconverter to any SSB receiver, even an old CB will do! I wonder how well one of the DIRECT conversion HF kits ($70) would do???

OK, before I BUG the AMSAT-BB mailing list to death, how many APRS'ers on this SIG have 1200 baud PACSAT capability?

From: Chris Williams <cwilliam@utw.com>

Concerning the recent discussion of position reporting via WO-18's digipeater. I don't understand the technique and won't venture an opinion. I'm just posting to let y'all know we here at Weber State do intend to keep the spacecraft's digipeater ON indefinitely. No plans to turn it OFF. It doesn't interfere with what the various students are doing with the spacecraft and we're glad to provide it to the amsat community as an experiment platform.

>

I remember an article about this in GPS World when they had just started. In addition to the local differential GPS, the plane used a down-looking radar for precise altitude from 40 feet down to the runway. I haven't seen the PS article, but the transponders may be a later substitute for the radar.

A local differential setup that broadcast carrier-phase corrections for each Sat. would get the approach path fine, but separate altitude data might avoid landing 15 feet above or below the ground. :-)

What 2 keys did you hold down? You should hold down the <clear> and <anemometer>
keys (top left and bottom left) simultaneously for at least 3 seconds.

>Peet bros even exchanged my key board and spent quite some time on the phone
>as we both worked side by side with an ohm meter checking the connection

Sounds like you have checked most obvious things. If they swap the keyboard,
you might ask them to swap the cable too.

For other Ultimeter software, see http://www.onramp.net/swta/wxsoft.htm

Good day All:

Being new to APRS I am looking for more detailed maps of the Los Angeles
area. I have casocal.map, does anybody know of a more detailed map
available?

Also I am looking for a more detailed cabak_lv.map for the Baket to Las
Vegas race. I belong to Orange County RACES and we are planning to use
APRS on at least 2 team follow vehicles.

Any suggestions?

Rendered body type: text/plain

```
New in Version 75a.
*** Moved all MAPLISTS to a new directory MAPLISTS to unclutter the
    APRS directory. I kept a brief copy of MAPLIST.USA in the APRS
    directory so you can still run old versions of APRS if needed.
*** New GATE rules:  Every GATE operator must put B E 0/10 instead of
    B E 0 in their INITTAPR.TNC file so they beacon on VHF if operating
on HF
* New GATE symbol with a BIG G n it
* Truck symbol is now a pickup. "u" becomes an 18 wheeler
* WX-DispWX and WX-ShowTemp commands show WX vice CALLS on map.  See WX.txt
* During REPLAY, FILEname is retained for subsequent use
* Fixed DF vehicle heading
* WX-JUST command latches ON/OFF (JUST-WX still is one time display)
* alt-SETUP-OTHER-REDRAW command toggles on an auto-redraw function.  The
  map will be redrawn every time your station Beacons.  This to keep the
  screen fresh for un-attended displays
* New CFIG75.APR file.  You can update your old CFIG73x file by adding
  3 new items to the line after RELAY near the end of the file so that
  it becomes 0,0,0,0 and then rename the file to CFIG75.APR
* New TORCHw, TORCHm, and TORCHe.bk files for olympic torch route
* Updated DIGIwest and DIGIeast.bk files
* SPRE.HST file shows the results of the APRS posits via SPRE satellite
* WO-18 satellite accepts APRS POSITS!  See SPACE.txt

NEWFIX22: Some further changes
* Changed MAPFIX Display menu to SETUP MENU
* Fixed MAPFIX TASK-TRIM command so that TRIM area matches WHITE BORDER
* Adds USAswest, COlorado, ILPeBlm, TXAstn32 maps
```

Yes, it is very possible that the transponders are being used to
substitute the down-looking radar, to enhance the position  by
triangulation. The article says "transceivers," so it is also possible
that they are using DME instead. (distance measurement equipment.) But
I am not sure if that is accurate enough (good enough resolution) for
the purpose. I am curious to know what they are: Xponders or DME.

WF> Actually, "category III" with respect to instrument landings has

You are correct. I should have been more specific. Under "zero/zero"
condition (believe that is Cat IIIa) I believe that it is mandatory
that the plane be flown by auto-pilot. FAA rules. Is that true? I've
heard that under certain circumstances, auto-pilot is mandatory. But I
am not sure if it is at Heathrow airport, London, or somewhere in U.S.

Rendered body type: text/plain

```
In response to my request for coordinating a digipeater on 145.79,
Arizona's coordinating body, ARCA, has refused to coordinate APRS
on that frequency.  Their concern is interference with space shuttle
up/down links on 145.8.  As we all know, and he admitted, 10Khz SHOULD be
more than enough clearance.  The problem as they see it is that most
packet users have no idea what their deviation really is and make no
attempt to correct it.  ARCA is following the "party" line of the
rest of the coordinators across the country in refusing to coordinate
APRS on .79.  This is going to become a real problem soon, ARCA says all
the coordinators are actively trying to de-coordinate the few states that
already approved .79.  ARCA says the coordinators probably wouldn't have
a problem with .79 if only there was some way to ensure that deviations
stay within the limits, but how would we do that?  Maybe start a
"deviation police patrol"? ;^)....
Anyway, I thought this should be brought up on the sig for discussion,
maybe we can get something worked out.

>"moderated."

There are good and bad moderators. The OS/2 family of echoes on FidoNet
are all moderated and after two years, I have never seen what you predict
will happen, happen.

I don't care one way or the other about moderation. My experience with it
has been good. From what I have seen on this sig lately, it might be a
good idea. Moderation takes a LOT of time and thoughtful consideration,
which is asking quite a bit from a volunteer.

As far as usenet goes...I much prefer the simple listserver with peer
pressure for control or outright moderation if that fails.

Perhaps another way to look at it: If a bunch of poeple are so all fired
up for a newsgroup....let them go create it and leave the rest of of who
are content with a reflector to suffer with our inferior service. I, for
one, seem to be getting along quite well, even given the occasional bad
manners and bickering. Fortunately, they are in the vast minority and tend
to center around just a few individuals. Sooner or later, they get bored
and go away.

As I have said before,  the APRS Sig is going to stay on the TAPR list-server
as an un-moderated mail list.  Moderation takes a LOT of time, and is not
needed.

This is the way I prefer it too..

> on that frequency.  Their concern is interference with space shuttle
> up/down links on 145.8.

WB4APR REPLY COMMENT:  This problem has been addressed ad nauseum.  The
following technical solution has been implenented:

1) DUring signal aquisition (monitoring for activity on 145.8), all scanners
   and radios should be set to 145.805 since the signal will first appear
   at +3 KHz doppler..  This serves two functions:
   a) The satellite ground station is in the best position to detect clean
      audio at first opportunity
   b) The satellite ground station is 15 KHz away from the packets on 79
      and will not be annoyed by squelch breaks on his radio
   During a manned pass, if the operator IS AT HIS station, then he tunes
   down 5 khz during the pass to maintain clear audio through LOS
   IF HE IS NOT AT HIS STATION, THEN HE IS NOT LISTENING.

2) All APRSdos versions since 74 have a "MINIMIZE" function built into the
code.  When a properly authorized station sends the "MINIMIZE" comand,
all stations in the network will CEASE automatic transmissions for 8 minutes.
This should have NO impact on routine APRS operations.

3) Any APRS station involved in emergency or priority traffic, can
OVERRIDE this MIMIMIZE if the operator is PRESENT at his station and
takes over manual control.

4) The MINIMIZE command may be initiated in any number of ways:
   a)  By a volunteer joint AMSAT/APRS station
   b)  By all SAREX stations with official/scheduled contacts
   c)  By an automatic AMSAT/APRS station running APRtrak that can
       predict all passes AND detects activity on 145.80
   d)  By the MANNED SPACE CRAFT ITSELF!  This packet burst can be added
as a BEEP on the end of every Shuttle voice transmission in a 0.5 second
burst.  This hardware interfaces to any radio via the MIC jack and is
available NOW for under $100.

So it can be done, and the necessary software is in place.  This was a
severe coordination problem since the spacecraft has chosen to operate up
to 9 KHz out of the satellite subband.  In response, the APRS community has
responded and made the necessary adaptation to their operations.

The best solution would be if the MANNED SPACE comunity made a similar
compromise gesture and moved up slightly to 145.805
```

PacComm uses Trimble OEM GPS boards and antennas integrated into our
products. We can offer the amplified antennas at $50 plus shipping if
they will fit anyone's needs.

They take +5v for the amplifier mmic and have an SMA connector on a 15 ft
(or so) cord. The antenna is quite small yet performs very well.

If anyone is interested I'll post the specifications.

There are professional versions of APRS and that is what was referred to.
Maybe I should have put the Bosnia thing under 'good that has come from
APRS' as opposed to uses of APRS.

Whenever I see the words ham and toy in the same sentence, my reaction is
to show how ham toys have been the source of 'real tools' i.e. there is
benefit to society and the economy from ham radio.

```

There sure are.

> The OS/2 family of echoes on FidoNet
>are all moderated and after two years, I have never seen what you predict
>*will* happen, happen.

I never predicted anything of the sort. My prediction was, and remains, a prediction about the *APRSSIG* rather than the OS/2 echoes. To further expound, IMNSHO if APRSSIG becomes "moderated" we will have what you call a "bad moderator." This is because of politics, plain and simple. The APRSSIG mailing list is so chock-full of political disagreements that I can't imagine any moderator that wouldn't do, perhaps unconsciously, what I predicted above.

BTW - if you haven't seen the turned-away postings to a moderated list or newsgroup, there really isn't any way to tell if the moderator is "subtly chang[ing] things to make it appear that political positions with which he agrees are universally accepted". So, in other words, you wouldn't "see it happen" even if it *was* happening! This is the main reason I oppose "moderation."

We now have had as much CRAP about if this news group should be moderated or not as first started the discussion..

I have stated that this group will remain an UN-MODERATED MAIL LIST.

Lets not beat a dead horse.

When I was stationed at Eglin AFB, FL in 1954, the highest point in the
state was a pile of oyster shell over 400 feet asl. The pile was located
near Mary Ester on the Inland Waterway and was the source for the base of
the runway at Eglin Field 9, later Hurlburt Field.

494. WO-18 Position/Status reporting

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 16 Mar 1996 22:27:12 -0500 (EST)
To: amsat-bb@amsat.org, aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960316222011.27934A-100000@greatlakes>
Rendered body type: text/plain

```
Continuing with the WO-18 digipeating discussion...  We now realize
that Tom Clark's 1 pulse per second output of the GPS can be used to
synchronize the position packet transmission slots.  Thus DOUBLING the
throughput to a SLOTTED ALOHA system!.  The following paragraphs
summarize this potential WO-18 application based on comments to date.

Sorry for the repetition, but I thought it important to keep the whole
idea within one message, until we arrive at the final concept based on
the knowledgable inputs from the SIGs.  Do not cross-post replies to
```

both the AMSAT and APRSSIGs. I will summarize contributions from both...

SUMMARY:
Amateur Satellite WO-18 has real potential for experiments with world wide amateur position/status reporting. Here's why:

1) The UPLINK requires only a 30 watt 2 meter FM radio
2) Many standard TNC's may be simply modified for the uplink
3) WO-18 covers everywhere in the world at least 2 times every 12 hrs.
4) Only an OMNI antenna is needed. No tracking required.
5) A position report requires only a single successful 1 second packet
6) As many as 500? mobile/portable stations can be tracked per footprint
7) Portable systems the size of a crackerjack Box (plus 8 C cells) are possible that would last for a month or more.

The objective of this system would be to provide twice daily POSITION/ STATUS reporting for all amateur radio equipped wilderness backpackers, DXpeditions, Rovers, RV'ers, SAIL boaters, Campers, and boaters.

THUMBNAIL ANALYSIS:
At least TWO 8 minute passes every 12 hrs = 16 min access time
Channel capacity 16 * 60 = 960 position reports
Packet length 1 sec
Aloha channel effeciency 18%
Resulting Throughput: 18% * 960 = 173 stations every 12 hours

BUT! With the GPS, we can use Slotted ALoha where all packets begin on the EXACT second (to the nearest 50 Microseconds)... This assures that any collisions perfectly overlap. The Slotted ALoha channel effeciency can approach 36% or almost 350 stations PER Satellite footprint.

The above analysis is for a single satellite footprint. Since WO-18 over Kansas sees the entire USA plus hundreds of miles at sea, it is a reasonable lower limit. But it would seem that East and West coast stations only see half of the collision potential on half of their passes, so the actual success potential is better. Can anyone provide a more rigorous analysis for this moving footprint and USA geography?

Still, a capacity of tracking 500 amateurs on extended trips is not something that will be saturated any time soon... Extend this to 5000 or more worldwide...

AREAS FOR MORE WORK AND COMMENT:

1) UPLINK TNC mod: Tom Clark says the TNC only needs an XOR gate and RC low pass filter to generate the Manchester UPLINK from the HDLC data and 1200 HZ clock. Anyone want to dig into their TNC schematics?

2) RECEIVE SITES: Due to the large footprint, only 4 RECEIVE sites are needed over the entire USA. North, South, East and West. Chas Richards comments that AUTOMATED reception of WO-18 is not trivial, but IS done. More work needed here...

3) For now, the receive sites simply digipeat the POSITS out onto HF and/or VHF. I can write a simple program that will gobble the posits up in real time, and then take its time reporting the posits out on the HF or VHF channel at a low duty cycle spread over hours so as not to overload that channel. The ultimate solution is a WEB page that gives everyone access to the tracking data. Any WEB masters interested?

4) What is the nominal success rate on a 1200 baud pacsat? Do you get 8 minute access most of the time? Has anyone written about or analyzed contention on the uplinks? How many *active* PACSAT equipped ground stations are there?

5) Will WO-18 digipeat a packet VIA WEBER-1,GATE,WIDE ?

6) What is the uplink RETRY period? I am thinking about 1 every 2 mins. The Aloha channel capacities assume ACKs and RETIRES. What are the channel capacities for these UI posits without ACKS?

NOTES: See this months QST article "The Road Less Traveled" about the under utilization of the 1200 baud Pacsats. Also the invitation to experiment with APRS via WO-18 in the Amateur Satellite Column.

Very small UPLINK systems are possible, because of the low 1% transmit duty cycle. At a once per minute rate a 35 watt modular power amp would need NO HEAT SINK.. The amp is the size of a MATCHBOX!
By limiting uplinks only to WO-18 passes (5 per day for 10 minutes

each) your total energy requirement would be less than 1 Whr per day.
Eight D cells could power this device for MONTHS! (20 WHrs per cell)

The GARMIN GPS-20 card is available for under $150 in quantities that includes the 1 pps timing output standard. Modify your TNC, hook up a 2m FM rig and you are on WO-18...

For more California maps, download CAMAPS06.zip from TAPR.org in the PC maps directory.

There are a few more LA area maps, plus the baker to vegas map we did for last year's event.

Make sure you copy CAMAP06 into your top-level APRS directory, then unzip with the -dn option. When running APRS, change to MAPLIST.CA by going to Maps, then Change maplist and enter CA.

Have fun,

RE: The Shuttle on 145.80.....

I have been reading clips here and there that the shuttle will broadcast on 145.84, this is a change from the original 145.80 proposed a few months ago. I have seen it in several forums but I can't guarantee this is true. Since they are the coordinators you would think they would know, or are they just "going with the flow" from the OLD DATA of a few months past ? You would think a "official" group would get the facts correct before making a decision to deny!

Hello all-

I just had a comment on MacAPRS that I wanted to mention, When I watch the traffic in the chicago area I see many mobiles, especially my self, and after a morning commute or
day the screen just has lots of cars and calls all lined up and down roads, and I always
have to refresh the screen, I wouldn't mind seeing MacAPRS have an opton either time set for every 5 minutes to refresh the screen that is in the foreground, or to do it when a station is updated (position-wise) also for weather, its nice the wind also, sometimes you can end up with a weather station with 30 wind directions, which is neat to get a windrose look at what peak speeds came from what direction, but then again, current situations you need to attend to the keyboard, just thought it would be a useful option

500. WO-18 Collision Avoidance

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 17 Mar 1996 05:11:51 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960317040030.28380A-100000@greatlakes>
Rendered body type: text/plain

Silly me... It just dawned on me...

Not only does the 1 pps GPS signal give us precise synchronism, the GPS also gives us ABSOLUTE time.... SO, you can assign all users their own absolute SLOT and therefore have NO collisions and 100% channel effeciency! During an 8 minute pass, there are 960 seconds so 960 users can uplink.

Now obviously, tho, you wouldnt want to be the 960th if your slot came up with the satellite only 1 degree above the horizon, so to allow for the constantly changing geometry and other factors, probably having a 4 minute cycle would give you 2 shots per pass (allowing 480 users). But probably the ultimate algorithm might be to have a variety of slot assignments such as this 60 second cycle:

SLOT NUMBER	USAGE	THEY GET	TOTAL USERS
1 thru 5	5 Priority ONE slots.	1 slot per minute	5
6 thru 15	10 Priority TWO slots.	1 slot every 2 mins	20
16 thru 30	15 Priority THREE slots	1 slot every 4 mins	60
31 thru 60	30 routine OPEN slots.	1 slot every 3 mins	43
	These slots (50%)		----
	are for unassigned stations	TOTAL	128

In this scenario, The priority ONE stations get a guaranteed free slot once a minute or as many as 8 to 12 packets per pass, and so on. A typical use for a priority ONE assignemnt would be for tracking the olympic torch this spring, or the cross Arctic expedition a few years back, or the Balloon flights, or any other such amateur radio event of national significance.

The other Priority slots could be reserved by stations for other events and situations. Still though, 50% of the satellite capacity is available for everyone on the normal slotted-aloha random unassigned basis at one packet every 4 mins. (120 slots) but the actual allowable loading would be 36% of that or about 43 more users as shown.

These numbers are PER PASS PER FOOTPRINT. You could easily assign the same priority slots to different stations on the East and West coasts.

ANYWAY.... This slot assignment idea shows the advantages of Tom Clark's precise timing ideas applied to a practical amateur satellite application. Although this same slotting technique can be used on any of the AMSAT birds to improve UPLINK channel effeciency, the beauty of this application is that EVERY GROUND STATION will already have the GPS UNIT for precise time!

Hello and thanks for reading this..

Anyone up to helping a person that fairly new to all this get the Aprs WX function up and running with his MFJ1278B TNC, Ultimeter 2000, and laptop??

I can not seem to get the U2000 to pass the Wx info along to Aprs. I have placed the Utilimeter 2000 in the packet mode and have entered my registration numbers for APRS and the WX deal..

Any and all help appreciated..

Thanks
Don

I have asked this same question (Well sort off) about a year ago, not the weather but the GPS position beacons. Why does every beacon have to have your callsign with it, why can't it be every 10th or whatever if it's still within a 10 minute time limmit?. There must be a way to use the GPS time function to make sure that you do ID every 9th or 10th minute. By the way Ron Version 75a does have that feature (Again well sort off) it was suppose to redraw your screen when your station beacons, but Bob didn't check it before releasing (He said this not me Hi) so now it redraws about every 5 seconds. On my 90Mhz pentium all i see is a little blip but would imagine on a slower machine it would contantly be redrawing, excelent idea tough once implimented the way Bob wanted it. But again i don't see why we need that many callsigns in a GPS beacon tough, but then again i'm not a programmer (The last statement thrown in for those that feel they must flame me). Just a question, not complaining fellows!!.

505. Maplists

From: William Nolle <ke4eer@hiwaay.net>
Date: Sun, 17 Mar 1996 07:37:03 -0800
To: aprssig@tapr.org
Message-ID: <314C319F.1BF1@hiwaay.net>
Rendered body type: text/plain

I was just wondering since all but one of the maplists where moved into a directory called maplist if there couldn't be a (L) for listing them all with the M-C something like is done with the O-D. I have 29 Maplists in that directory now and being the old man i am, in no way am i going to remember all those extensions. I have 7 or so just for Alabama alone, since each maplist will only hold 150 or so maps i think there's a need for that feature. Just an idea to make changing maplists easier.

506. Re: [APRSSIG:7645] WO-18 Position/Status reporting

From: Steve Dimse <sdimse@bridge.net>
Date: Sun, 17 Mar 96 09:15:35 -0500

To: <aprssig@tapr.org>
Message-ID: <199603171413.JAA17664@newworld.bridge.net>
Rendered body type: text/plain

Bob...

I love the concept of a packet satellite for APRS position reports, but I don't think the system you describe using WO-18 is practical.

1. While the uplink system is relatively easy to run, the downlink is quite difficult. I have used the 1200 baud pacsats, and it ain't easy. Yes, automated reception is possible, but expensive and difficult to set up and maintain. Manual tracking is best described as a labor of love. I don't see many users willing to dedicate hardware worth say $500 to a system which may only be gated to handful of sites, and is only capable of transmitting 4 position reports a day. I have the equipment and experience to use WO-18, and I love APRS, but I'm not willing to put out the effort to gate on a regular basis. Have you heard from anyone who has experience with the 1200 baud pacsats that *is* willing to commit to regular gating?

2. While a system that could run independently for several months on D cells would have some exciting applications, the present hardware won't do that. You would need a custom programmed microprocessor that would figure out the pass times, turn on the GPS a couple minutes prior to get a fix, and transmit at the correct moment. Even the most efficient microprocessor requires abt 0.2 Watts/hr which would deplete the batteries quickly. A processor which would figure out the time of the next pass, and then put itself to sleep would work, but require not only custom software but custom hardware as well. Also, how would you handle getting updated keps to the processors out in the field so that they know when a pass is to occur? They are usually accurate to 30 sec or so after a month, but beyond that tend to fall off rapidly. Even small errors could play havoc on the slotting system.

3. Using the GPS time to sync everyone to a set slot would work well as long as no one else is using the satellite. If Weber is uplinking commands, that would cause major collisions. I would expect that Weber uses higher power to an az/el beam for the uplink, so the APRS traffic would probably not QRM them much.

I'd be glad to dust off my PSK modem to participate in a test of the satelitte though. What I'd love to see (and be willing to help support with $$$) would be a dedicated APRS pacsat. Anyone know of any space engineering students in need of a project???

507. RE: Call Signs with every packet

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Sun, 17 Mar 96 10:05:49 EST
To: aprssig@tapr.org, ke4eer@amsat.org
Message-ID: <CMM-RU.1.4.827075149.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

Bill, KE4EER Wrote...

> I have asked this same question (Well sort off) about a year ago, not the
> weather but the GPS position beacons. Why does every beacon have to have
> your callsign with it, why can't it be every 10th or whatever if it's
> still within a 10 minute time limmit?.

I think you are missing something here.. The TNC sends out ITS call sign with EVERY SINGLE PACKET IT SENDS, NO MATTER WHAT!!

APRS, MacAPRS & WinAPRS, all use the call sign received by the TNC to recognize WHICH station it is from, this NOT extra data sent out..

The ONLY time APRS, MacAPRS & WinAPRS explicitly sends out the call sign is when you create an OBJECT. This position report is somewhat different and if you look at the data, it shows YOUR call sign as the sending station, AND the callsign (or name or whatever) is included in the DATA instead of the HEADER.

This is even more obvious if you have ever run into the HEADERLN OFF problem.

If HEADERLN is ON, the TNCs displays the following:

```
WU2Z*>APRSM:
```

```
@171455z4027.03N/07428.71WMPHG6260/ MacAPRS  2.4.5 -245-<76>

If HEADERLN if OFF, the TNC displays the following

WU2Z*>APRSM:@171455z4027.03N/07428.71WMPHG6260/ MacAPRS  2.4.5 -245-<76>
```

The programs DEPEND on the call-sign and data being on the SAME line so that it knows what data goes with what call-sign.

(The HEADERLN being ON is one of the more common problems I encounter with people trying to set up MacAPRS and WinAPRS for the first time.)

In the case of a STAND-ALONE GPS box, you get the following:

```
WU2Z-9>APRS:$GPGGA,105330.00,4029.642,N,07426.334,W,1,03,2.0,-30.0,M,-33.8,M,,
```

Now, if we were tracking 10 stations, and the ONLY data we got was the GPS data, how would we know which station was where?

Every!!! packet MUST have a call-sign with it for this to work.

On top of that, it is absolutely impossible to transmit a VALID AX-25 packet WITHOUT a call-sign.. And, I think it is also ILLEGAL to transmit an AX-25 packet without a call-sign.. (But I am not sure on this one)

Rendered body type: text/plain

I recently downloaded the 75to75a.zip file and installed it in aprs. According to Bob, one of the new features is an automatic screen updating feature which is turned on with the Alt-S, Other, Redraw command. The screen is suppose to update whenever you transmit your beacon. However I see my screen "flicker" once every 5 seconds when this command is turned on. I assume it is trying to update the screen each time as if you are continuously hitting your spacebar no matter if you are transmitting your beacon or not. Is this a bug Bob?

Tru,
Yes, the Sproul's are working on such a program. Currently their map maker used USGS info to make the maps. Their goal is for you to be able to use other map programs as well. Of course, that is if those who own the rights i.e. DELORME don't wish to share code...anyway, at dayton, there is supposed to be a CD rom with programs and maps.
Jerry

Just to let everyone know Kevin and I are still on 3.585 LSB operating as a
GATEWAY. We are hoping to get more users on even if they do not have GATEWAY
capabilities via 80M. I would like to see the Jacksonville and Daytona area get
on, we have been in contact with others and hope that they will join in soon.

If you have GATEWAY capabilities to 145.79 set mygate to GATEFL (NOT FLGATE THAT
WAS THE OLD WAY) and your HF UNPROTO path to APRS VIA GATEFL,WIDE while your
path will stay the same.

If you are a VHF user with a 80M gate in the area set your UNPROTO path to
WIDE,GATEFL,GATEFL,WIDE or some variation that fits your local area network.

Storm season is coming and we hope that everyone will stay in touch to keep
abreast of all the WX conditions that speed across the state.

NO.......

DeLorme as VERY protective of their data and won't tell you anything about it..

We are working on the ability to use BIT-MAPs in MacAPRS, but we are not going
to get back to working on this until AFTER dayton due to do much work to do
on WinAPRS..

On the other hand, we ARE working on making maps from TIGER data, which when
finished, will be very good and have MOST of the info you need/want in them.
Including (hopefully) street names, etc..

     You're sort-of right.  When the Shuttle is engaged
in a mission with MIR, the downlink frequency is 145.84,
uplinks are 144.45 and 144.47.  Note that these freq's
are also used for communication between the two space-
craft.

     Under normal circumstances SAREX uses 145.55 as the
downlink and 144.91, -.93, -.95, -.97 and -.99.  Unfor-
tunately for those of us in the New York City area that
would like a crack at a SAREX contact, .91 thru .95 are
in use locally for DX cluster and there's node activity
on .99!   73

Hello.

Latest information on the TAPR Digital Forum at Dayton as well as the Friday
evening BASH is on www.tapr.org.  Don't forget that this is the TAPR APRS
Special Interest Group, so it fits into the TAPR Digital Forum :-)

I also posted the full schedule about two weeks ago on tapr-bb.  We use
tapr-bb to post information on TAPR events and happenings, so it is a good
```

place to subscribe to get the latest info on what TAPR is doing or special issues.

Maps and stuff are on the web page.

Cheers - Greg, WD5IVD

TAPR Dayton Activities '96
Dayton Hamvention is May 17-19, 1996

```
TAPR Schedule
-------------
Friday
   12noon -- Exhibit Area Opens
   1:00pm -- TAPR Digital Forum Begins
   7:00pm -- PacketBASH
       (Dinner, Prizes, SIG meetings, Banquet Speaker!)

Saturday
   8am -- Exhibit Area Opens
   6pm -- Exhibit Area Closes
   9pm -- Informal SIG Meeting (TBD)

Sunday
   8am -- Exhibit Area Opens
   2pm -- Exhibit Area Closes
```

1996 TAPR Digital Forum (Friday)

The TAPR digital forum should be a great forum this year.
If you have time at Dayton -- be sure to attend the meeting!

```
1:00 - 1:45pm
       Introduction to Digital Communications
       Greg Jones, WD5IVD

1:45 - 2:30pm
       Making 56K Operations a Reality!
       Barry McLarnon, VE3JF

2:30 - 3:15pm
       Spread Spectrum Technology and current issues in
       Amateur Radio
       Phil Karn, KA9Q

3:15 - 3:45pm
       DAS and PCON and there use in Emergency
       Communications
       Paul Newland, AD7I

3:45 - 4:15pm
       BBS Issues and Trends
       Barry Buelow, WA0RJT

4:15 - 5:00pm+
       APRS Update and SIG Meeting
       Bob Bruninga, WB4APR and Keith Sproul, WU2Z
```

1996 Packet Bash!

The 1996 "Packet BASH" sponsored by TAPR and the Miami Valley FM Association will be held on Friday of the Dayton Hamvention. The BASH will be moved this year to a very much larger site! So, if you were one of the folks that felt it was just too crowded for dinner -- you were not alone.
The reason for the move was that TJ's Restaurant was just a little small for 1995. The event will be held at the AT&T site in Oakwood, OH (formerly NCR). The event will be catered and the dinning room holds about 400 people! So the more the merrier! To make the event even better -- we can stay a lot later than at the TJ's site last year, so we should have time for informal discussions after dinner.

A buffet dinner,

```
  a raffle for some neat prizes,
  a great program,
  and lots of fun will cost approximately $20 per person.

We hope that this will provide an opportunity for packet and digital radio
enthusiasts to have a great night out while at Hamvention.

The schedule of events for the Packet BASH is still tentative, but will look
something like this:
       1900 -- Dinner
       1945 -- Welcome
       2000 -- Keynote Address
       2030 -- Raffle
       2045 -- TAPR SIG Meetings

Talkin will be on 146.415 simplex.

For more information, send email to "packbash@ag9v.ampr.org" or stop
by the TAPR booth at Dayton for schedule and map.

Banquet tickets will be available until May 1st from the TAPR office.
After May 1st, tickets ordered will be available for pickup at the TAPR
booth. Walk-up to the event will be accommodated as best as possible.
There is limited room for Dinner. Amateurs who wish to attend the
speaker and discussion are asked to arrive around 2000 (8pm).
```

You should be using data logger mode for both stand alone and
aprs !!! the modem mode will not work for these programs
also the packet mode will lock everyone on channel up if used
in the standalone mode...
hope that helps you   press the bottom left and top left buttons
on the u2000 at the same time for three flashes of the lcd
readout for data logger mode.. 2400 baud

Rendered body type: text/plain

```
The next Central Illinois Balloon Association (CIBA) high altitude balloon
launch is scheduled for Saturday, April 13, 1996.  Lift-off time for the
```

helium filled balloon is set for approximately 9:00 a.m.(CDT) from Washington,
IL. The rain date is set for the following day, same time, same location.
Estimated ceiling height for the package should be a minimum of 85,000 feet.

Two payload packages will be used. One package will be equipped with a GPS
receiver and a TNC operating on the APRS frequency of 145.790 mHz. Also on
board will be a beacon transmitter operating on a frequency of 146.565 mHz
simplex, a 35 mm still camera, and a temperature probe to record the inside
and outside temperature extremes.

The other package will contain a cross-band repeater. The input frequency
for cross-band repeat operation will be 147.585 mHz with a 146.2 Hz CTCSS
tone, and an output frequency of 446.025 mHz.

Recovery operation frequencies will be various repeaters in and around the
projected flight path, and a car-to-car/at-scene simplex frequency of 146.415
mHz.

A special event station is also planned to operate at or around 7.250 mHz
LSB, using the call of AA9MK. Watch and listen for possible changes to this
notice.

522. Re: [APRSSIG:7664] U2000 & PICOpaket

From: "David E. Barrett" <barrettd@crpl.cedar-rapids.lib.ia.us>
Date: Sun, 17 Mar 1996 19:21:05 -0600
To: aprssig@tapr.org
Message-ID: <199603180119.TAA24835@tapr.org>
Rendered body type: text/plain

Here's the setup I'm using to run my U2000 with the PicoPacket TNC
two serial port.
U2000 in datalogger mode
[!!000000C501660000281B02AA--------004403BB]

```
TNC settings as follows
gpstext !!
[string to recognize]
lpath aprs v relay,digi1,digi2,digi3,wide       [digi path for wx data]
loc e 30
[becon wx string every 5 min]
b e 30
[becon btext every 5 min]
BText    !4156.45N/09142.42W_                        [postion format for
standalone WX]
unproto aprs v relay,digi1,digi2,digi3,wide  [digi path for becon data]
uimode on
[seemed to be the secret trick]
mya relay                                                             [so
you can still relay]
```

Plus the normal stuff like my, myp and so forth. I use an rs232
cable that has two rs232 connectors per end, so it can pass through data on
both ends. With this cable I can still us my Peet Bros datalogging software
as well as transmit WX data in the APRS format. Special thanks to Bob for
his patience in not pointing out my stupidity (it's all in those readme
files he wrote) and to Paul at Paccom for the firmware EPROM chip he sent.
Also on a 2 port Pico it does make a differece which position the
switch is in, make sure it's the left on position, looking at the back, and
not the right on position.

```

ver 75 still locks up when receiving the packet mode sent
from a stand alone u2000 wx.
Have not checked 75a yet I have to get KE2VW to send some
frames out to see if it locks 75a up, I will do that as soon
as I hear from Greg.
I sent you a couple messages with the screen dumps
that show what aprs75 shows on the screen when it locks
up.

525. SIMULATE.bas bug

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 17 Mar 1996 22:31:43 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960317222745.470D-100000@greatlakes>
Rendered body type: text/plain

WA7ZZB played a lot with my first SIMULATE.bas and discoverd that it was not properly detecting all collisions. I fixed the problem in the version of simulate.bas this is being distributed in version APRS75a and the upgrade file. If your SIMULATE.bas does NOT produce BLUE packets and YELLOW successes, then you have the old one. Dont use it. It will give you false better preformance simulations....

To the Agrelo class problem, it drops the number of transmitters per frequency by about a third... I think....

527. $GPGGA sentence

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Sun, 17 Mar 1996 19:56:58 -0800
To: aprssig@tapr.org
Message-ID: <199603180356.TAA09251@poseidon>
Rendered body type: text/plain

All GPS/APRS USERS.   From Motorola Tech Support..

NMEA-0183 protocol/sentences for the $GPGGA data string, giving time, position,
altitude.

```
       1      2       3 4        5 6 7 8   9   10 11  12 13
$GPGGA,xxxxxx,zzzz.zz,N,zzzzz.zz,W,x,x,xxx,uxx,M,uxxx,m*xx<CR><LF>
```

No	Field	Units/Range
1	Time/UTC of Posit.	Hours, Minutes, Seconds/ 00-24, 00-59, 00-59
2.	Latitude	Degrees, Minutes and Hundredths/ 00-90, 00-59, 00-99
3.	Direction	N = North, S = South
4.	Longitude	Degrees, Minutes and Hundredths/ 00-180, 00-59, 00-99
5.	Direction	E = East, W = West,
6.	GPS Quality Indicator	0 = GPS not Available 1 = GPS available.
7.	Number of Satellites Being used..	no units/ 2 - 4
8.	HDOP	no units/ ? - ? (Don't know what means, don't ask)
9.	Antenna Height	meters/ -99 to 99 where u is sign if minus.
10.	Units	M for meters.
11.	Geoidal Height	meters/ -99 to 99 where u is sign if minus
12.	Units	M for meters
13.	Checksum (optional)	Hex 00-7F

If you notice the above format in a packet message, this will give you some information on what the position report means. For APRS the $GPRMC sentence is more acceptable as it give Time, Positionk, Course, and speed. Whereas this $GPGGA data string, only give Time, Position and Height, which I have been told is not accurate height MSL on GPS receivers, below about 2000 feet.

```
>What exactaly is nessesary in the way of ant. and is tuneing due to
> doppler shift nessesary?

Reception is possible with an omni antenna, but far better results
obtained with a circularly polarized beam on an az/el rotor. A vertical
or horizontal beam also works, but is subject to deep fades.

Active tuning is needed, and is critical. The radio must be within 50 Hz
or so to lock the modem onto the signal. The doppler shift is more than
7000 Hz over the course of a pass. The beginning and end of a pass have
slowly changing doppler, with a rapid change in the middle...the same
time the beam heading is changing quickly. You need 4 hands to do this by
manually. I have a TrakBox now which handles the antenna rotor, making
things a whole lot easier. The PSK modem includes outputs to drive the
up/down buttons on most rigs to provide a measure of automatic freq
control as well, but the initial lock-on must be done manually. I have
not had much luck with this, as any fade of signal tends to cause the
modem to lose lock.

The fully automated systems use a computer to aim the antennas and tune
the radio directly. With good keplerian elements and an accurate clock,
the doppler can be predicted accurately enough to get the modem to lock
onto the signal.

Any volunteers???

Steve KO4HD

No such thing as a zero/zero landing.  Even Cat IIIa requires 600 feet
visability.  Being a pilot of 40 years or so, instrument rated etc with over
6000 hours heavy and  multiengine jet time, I can tell you that isn't much.
Cat IIIa landings require full autopilot operational and engaged.  Cat II
can be hand flown as long as all the nav equipment is operational (full
redundant).  I have done that many times but never have had the opportunity
to fly Cat III - hell, Cat II is scary enough for me.  I am retired now so I
don't guess I'll get the chance except maybe in the simulator.

Happy landings.

Hi Bob and others...

Since I run a gate, I frequently switch from VHF mode to HF mode and vice
versa.  The other evening, just after installing 75a, I happened to
initiate the program at 1859 EST, or 2359 GMT.

I started in VHF mode....did a few things, and then switched to HF mode.
I immediately noticed a problem, after I switched to HF mode, my posit
reports were going out with the time stamp of 162407....2407 hours GMT?

The correct time should have been 170007z.......this creates real havoc
when trying to dead reckon track an object...

Bob, can you check on this pls?

Thanks in advance,

Kevin KD4UYR

>
> Does anyone know how the system work? I'd like to know.

There are several components to this.  It's the subject of intense work at
Stanford by the Aerospace engineering department, as well as a friend who's
```

getting his Masters' degree on a variant of this (N5JXE).

The local GPS hardware "around" the airport are fake satellites, or "Pseudollites" in the parlance. They send GPS non-dithered position information out. These pseudollites do not move, but conform to the GPS Specifications, and send the exact same signals as "real" satellites that are orbiting overhead. Note that there are 24 satellites in the complete constellation, but room in the GPS spec for 36 transmitters, one of which is actually "not available" since its address signature is a repeat of another.

The 35 available "signatures" are the Gold Codes, and as long as the pseudollites send the appropriate Gold Codes and do not interfere with orbiting PRNs or nearby PRNs, they can be received as "real" GPS navigation data.

The system also uses differential GPS to improve the error associated with both system inherent ("common mode") and externally induced (Selective Availability) errors. I do not recall if they are using the lower resolution corrections or the higher resolution corrections normally associated with surveying.

An interesting piece of their work involved transmitting their corrections data on L1, rather than on a separate frequency, using one of the Gold Codes as a PRN. Seems the Trimble receivers they were using had no trouble grabbing it and knowing what to do with it!

Hope this helps. Are you interested in further info? How they coupled the GPS data to autoland? What hardware they used? I can probably find out.

534. Re: [APRSSIG:7628] APRS coordination in AZ

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Mon, 18 Mar 1996 08:17:03 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199603181417.IAA03574@solar.cs.tamu.edu>
Rendered body type: text/plain

To the best of my knowledge, there is not an active attempt by the coordination community to decoordinate APRS activities on any channel, where it's been recognized.

That said, I'm afraid the coners of your coordinator are probably valid, with regards to the spectral purity and tuning of the typical packet radio (did I really see someone suggesting Reagency radios here? I really hope not!). Because most of us think in terms of 5khz bandwidths for VHF/UHF FM, a lot of folks, who may even have access to some form of test equipment tend to adjust their deviation to "5 khz" by meter, without regard for the spectral display. On this path lies danger. Worse still are the folks who adjust their output "by ear" until it sounds like someone else's. This way's truly scarey.

I'd like to think the typical APRS user's more astute, but that may not always be the case.

>From a pragmatic aspect, I think interference with the Space subband is overplayed. However, 'til we can convince folks that the typical APRS user has a clean radio, and we're not going to overload the channel with blathering BBS traffic, I suspect there will be some reluctance on 145.79.

I'd really like to see a push with all the coordination bodies to set aside a single UHF channel nationwide for APRS, now while there's some time to do it. That'll require new radios, and new sites, which are admittedly a pain. What it will also allow is migration to higher speeds which is a _GOOD_THING_ for future growth.

WB4APR REPLY COMMENT: Every TNC can do the SLOTTED ALOHA with no additional hardware. Just hook the 1 pps timing signal from the GPS to the external carrier detect input of the TNC. This signal is low for 900 ms out of every second. When it goes high, then it can send a packet. Lyle Johnson points out that you only get the theoretical doubling of capacity if the packets are of approximately equal length and approximately the full size of the slot. In our case, 1 second in 1 second for all... Perfect match...

WB4APR REPLY COMMENT: You will get many responses, but most will entail the efforts of DF specialists with special (tho common) equipment. The easiest way to involve everyone in your group is to simply use the OMNI DF technique in APRS. Here is what you tell everyone on your repeater.

"Everytime you hear the jammer, tune to the input of the repeater and note the signal strength and your location. EVEN IF YOU DONT HEAR IT, THIS INFORMATION IS *JUST* AS VALUABLE, IF NOT *MORE SO*!!! Report the following information preferrably by phone or other channel to someone with APRS:"

```
      YOUR LOCATION (lat/long prefered, but any recognizable reference)
                    (so that your location can be placed on the map)

      SUBJECTIVE SIGNAL STRENGTH: from 0 to 9.  ZERO is important!

      YOUR ESTIMATED ANTENNA HEIGHT ABOVE AVERAGE TERRAIN.  Look around
                     you.  For cars, use 10 feet unless you are on an
                     obvious hill top...
```

The APRS station can enter each of these "omni" signal reports and APRS will display colored circles around all reports proportional to singal strength and antenna height (using MAPS-PLOTS-DF command). The ZERO reports draw BLACK circles and eliminate all those areas where the jammer *IS NOT*. Note, if the APRS station has his TNC and radio turned on, EVERYONE else with APRS on that channel can see the same geographical plot too! Even HT reports are valuable. But be sure to indicate an antenna gain of 0 and a height of 0 to account for his poor receiving radius...

In just one jamming incident and with the typical dispersion of mobiles during commute time, these overlapping circles (mostly the ZERO reports) will make it very obvious what neighborhood is involved... Even if the jammer is also mobile, you will soon build up a profile of where he commutes... If you have APRS, load the DF-OMNI demonstration file and see what the plot looks like... You should have no problem getting to within a mile or two of the jammer using this technique where *EVERYONE* can participate...

Sure wish I'd had this a couple or 3 years ago in Houston: We found the guy using "traditional" (and some extraspecial) techniques, but the manual plotting of multiple mobile reports was a real drag!

vamaps08.zip has been uploaded to ftp.tapr.org ,This file replaces all previous Vamaps*.zip.

This is our most up to date collection of Virginia maps. Most maps are of the 8 mile range. There are some 1 mile city maps for Lynchburg and Martinsville. Two maplist are included. Maplist.va views all the 8 mile and above maps of Virginia. Maplist.vac suppresses some 40+ maps in eastern Virginia, for viewing of the 1 mile city maps. About 2/3 of the maps have street and city labels. Some maps still need work, I will post an update when these maps are finished. Pete W4WWQ and myself WB4PAN hope you enjoy our joint effort on prepareing these maps.
Unzip with PKUNZIP -d to place maplist and maps in the proper directorys.

Rendered body type: text/plain

For general info, Discovery is running a great show "Eyes in the Sky" which discusses, among many other things, how GPS is being used around the globe. It's easy to see some APRS-like activities happening, including one where GPS-equipped golf carts WITH data radios linked back to the club house are being used to update their positions on the course. Further, the player can depress one of several buttons on the panel and find out how close he is to the pin, then another button to ask for professional help from the clubhouse. Very professional, maps all nicely done, definitely a "way cool" system. If anyone knows where the golf course mentioned is located, I'd like to hear about it. Aloha, Dave/WH6YC. (Still not as neat as the cows in space project)

Bob

Wouldn't this approach mean that everyone is trying to transmit during the
same
100 millisecond slot? How do you enfore everyone to deconflict.... or are
you
relying on the FM capture effect to only get the strongest signal.. and
standard
CSMA/CA and the effectiveness stats that go along with Collision Avoidance??
I'm inclined to believe the doppler problem is more serious for most
stations...
However - the applicability of this technique to ground TSPI (MILSPEAK for
position tracking systems - time space position info) is real good....
especially
when combined with TDMA for same freq reuse (common for TSPI systems)
and slow update rates (usually, high dynamic TSPI data is at 10 Hz rate...
and
includes pitch roll yaw rates along with x y z accelerations... and aux
data... for
ground vehicle TSPI.... 6-10 sec updates are more than good enuff....) BTW
the
vacant TDMA slots are usually reserved for the repeater use in TDMA TSPI
here...

```
Do you have only e-mail access to Internet and think you are missing a lot
of what the WWW has to offer?

There is a unique server that will read a WWW address and send
it to your e-mail account.  Try this example to get the TAPR/SIG:

Send a message addressed to:

              agora@dna.affrc.go.jp

Leave the subject line blank.

In the body of the message enter:

              send http://www.tapr.org/tapr/html/sigs.html

Hypertext search addresses found in the retreived text will be identified
at the end of your returned e-mail message allowing you to fetch the next
level of information.

For GPS information, try this address:

                   http://www.cnde.iastate.edu/gps.html

I hope this will help some of the SIGs readers to get more information
from the WWWeb.

```
Today was my second atttempt at WO-18.  I forgot about it until half way
thorugh the pass.  Here are my "newbee" experiences:

Really tough to manually tune in in the middle of the pass!  But once past
oerhead, the doppler tames down significantly.  I am using a high gain
beam, so I am actaully at a disadvantage, cuz if I ain't pointed at it,
its worse than a ground plane.  Talk about arms and legs flailing!!
```

The AZ-el contorls, the constant dopler, the keyboard, the toher PC
running instantrack! It would have made a nice movie...
Again I copied several packets and this time copied 4 digipeats....
The W4XYZ was my TNC, cuz I hadnt used this satellite TNC before and
never thoght to check the MY CALL first....

Attached is a copy of the packets received. I edited out about 50% of the packets and chopped them down to 80 character lines. But it gives you the idea of what you will see. Next pass, I will try the path of VIA WEBER-1,GATE.... I assume I got about 10% of the total number of packets if Im lucky...

I dont know where I'm going with this, but Im just having fun. I been meaning to check out the PacSats someday anyway, now I have an excuse...

Rendered body type: text/plain

I forgot about the first pass today, but remembered in the MIDDLE of the 2nd pass. Here are the experiences of a "newbee"....

1) Darn hard getting a lock in the "middle" of the high doppler! Much easier at beginning or end...

2) Im using an AZ EL mount cuz its whats hooked to the radio. But unless its pointed at the bird, it is worse than an omni (ergo you must track it)

3) I copied probably 30 packets (probably 10% of total per pass?)

4) I copied my digipeated packets (4)!

Trying to manually track the ANTENNA, Doppler, and operate the INSTANT track PC and the TNC PC would make a nice "charlie Chan" movie!

Here is a sampling of what I received (I edited out all binary packets since when I tried to put them in this message the first time, they crashed my internet mailer!) I also cut out most of the duplicate packets too.... I put the asterix at the beginning to highlight mine.

```
WEBER>SPECT:....garbage

But if you leave the radio, GPS, and TNC on all the time, beaconing every 4 minutes, the D cell battery pack isn't going to last a day, much less 'months'. That was the thrust of this comment...you'd need custom microcontroller hardware and software to get that kind of battery life.

549. On the Road with APRS

From: Mike Musick <71301.3106@compuserve.com>
Date: 18 Mar 96 15:31:35 EST
To: <aprssig@tapr.org>
Message-ID: <960318203135_71301.3106_FHJ81-1@CompuServe.COM>
Rendered body type: text/plain

Or, rather, "How I Spent My Summer Vacation" <g!>; i.e., some random musings about 17 days of on-the-road with APRS.

As "announced" about three weeks ago, my wife and I just returned from an extended driving vacation encompassing 12 Western states. I had APRS 7.5 running on an HP200LX palmtop throughout most of the trip, hooked-up to a GPS-45 through an HSP interface. We were beaconing posit reports at 180 second intervals, using a WIDE,WIDE via, and were running 50W.

Generally speaking, APRS performed pretty well. It became clear early on that my own lack of detailed familiarity with the program (I normally run the Mac version) caused a few minor glitches, none insurmountable or debilitating.

Probably the biggest annoyance came from using the older maps and USA maplist, and this created some gaps in the route coverage. The main problem with this was that in some cases we'd be only halfway across a state and then the auto-track would switch to the next state, leaving me with a blank map. Late in the trip I also discovered that the maplist was requesting a map for the Midwest that I didn't have, so some quick editing fixed the maplist and stopped APRS from crashing on map display.

Hardware-wise, there were some antenna problems a few days in. I was using a glass-mount antenna that has an adjustment capacitor, and it managed to get knocked out of whack four days into the trip while traversing bumpier sections of old Route 66. It was a real challenge to get it readjusted without an SWR meter. Other infrequent trouble came from the power connector to the TNC, which would make intermittent contact under some conditions. Sometimes this would put the TNC in a "mystery" state, and after a half hour or so I'd notice that we weren't transmitting, and would then have to re-init the TNC.

The APRS radio managed to not bother the other gear in the car too badly in terms of breaking squelch, but of course at 50W it would desense everything during the brief transmissions.

Other APRS stations were seen in Tulsa, Amarillo (many thanks to Ben for playing "tour guide" on-the-air!), Barstow, the Modesto/Stockton area, San Francisco Bay area, and St. Joseph/Kansas City. I'd post the heard list here, but there's still some data sifting to do, and I also mis-keyed and lost a couple of log files. I was surprised to hear no APRS stations in Oklahoma City and Albuquerque.

In KC we encountered an HF gate; initially I thought that we were getting all sorts of local activity. Only on stopping and reviewing the position list did I realize that most of the stations seen were coming through the gate. I don't mean to add to the GATE firestorm, and it's certainly fun to watch gate stuff at home, but gated HF traffic seems to clutter the various lists when you're a VHF mobile or trying to track one.

The 145.010 freq in California was spottier than I expected. I was surprised (and pleased) with seeing stations in Barstow and Daggett, but a jaunt down into Victorville and the Antelope Valley ran square into a PBBS on the frequency. APRS was announcing new (but non-APRS) stations like crazy, and it *really* inflated the heard list.

Speaking of clutter, HSP makes a mess out of the [V]iew window, and was scrolling packet stuff off with the GPS NMEA stream. Any way to filter out the NMEA from the [V]iew on a GPS inquiry?

I have one big regret, only discovered after reading the SIG archives: the railroad mobile event of 3/13 coincided *exactly* with our route and schedule - but I was fairly tired on leaving SFO, and didn't bother with the APRS stuff until getting beyond Reno.

Two things I thought would be a problem weren't. The APRS "beep" annunciators were not annoying at all, and didn't even create spousal objections - in fact, she was sort of getting into the fun of APRS and the route tracking. And the screen distortion caused by the HP200LX's odd aspect ratio was a non-issue.

One thing, however, *was* a problem. The B&W display just doesn't cut it. With APRS's reliance on color to differentiate map features, the more complex a map was, the less likely meaningful intelligence could be gained. In retrospect, I should have turned-off certain map features, but it still wouldn't have helped with rivers vs. roads vs. borders, which I would have wanted "on", but couldn't be distinguished on the display. I guess different line thicknesses would be a huge aid to intelligibility in B&W, but since I'm a long-time QBX programmer myself, I certainly understand why Bob doesn't want to or can't do this.

One wishlist item, though: the one (and only) issue that made starting APRS a pain was setting the auto-track on my own station. It would be very nice if this could be accommodated. Since auto-track wouldn't/didn't save in the startup defaults, I'd have to wait for GPS lock and the program to startup before manually activating the auto-track. This would delay getting on the road and created a couple of tense discussions after rushing the XYL to get going.

All of this, FWIW.

APR REPLY: Yes, if they all had packets ready to go that second. But they are only going to beacon their posit once every 3 minutes or so... This 1 second slot, only forces any that are going to send a packet that exact second, to perfectly collide so that they dont mess up the next second as well... THats where you get the doubling of throughput...

Mike... Very interesting. How did you power that set up? I have visions of multiple power cords coming out of divider plugs from the cigarette lighter, and slowly strangling the people in the fromt seat. I find that self contained batteries are
ok for my GPS, TNC, & HP100 for short trips, but I like to use ship's power for an all
day trip. My Palmtop is fine for all day, but the TNC is close to power limit, and my
GPS (Motorola Traxar Plus) eats a set of 6 AA batteries every 3-4 hours, so remote power is a must.

WB4APR REPLY COMMENT: I CAN! Remember, the serious PACSAT folks have moved to the 9600 baud satellites, and even the 1200 baud users use AO-16 and 19. WO-18 for years has only had a downlink for pirctures. There is no established base of existing WO-18 users for COMM uplink purposes. EVERYONE to date that has reported digipeating via WEBER-1 have all reported seeing NO ONE else...

If you are using APRtrak or APRS, be sure to set CONTORLS-FILTERS-OTEHR to ON so that you will see ANY digipeated packets even if not APRS...

My recommendation is for you to hit XMT-POS repeatedly to send your position through. You might also want to send a BULLETIN and if you see anyone, SEND them an APRS message! This digipeater is a normal APRS digipeater as far as technique is concerned.

555. Boston & NS Trip / Tracker Planning

From: "Art Smith" <ALS@CEIS.UHCOLORADO.EDU>
Date: Mon, 18 Mar 1996 15:15:58 MST-0700
To: aprssig@tapr.org
Message-ID: <A71513E2D36@ceis.uhcolorado.edu>
Rendered body type: text/plain

To All in the Boston, Cape Cod, Southern NH, Boston to Portland ME, and Yarmouth to Shelburne NS areas:

I will be on a business trip to Boston May 17-23 for the NFPA meeting, followed by vacation on the eastern shore of southern Nova Scotia through the 27th.

System will be a Garman 45 / PacCom TNC / Kenwood handi with a 1/4 wave mag mount. 5w when mobile, 1 watt when portable. I may take a 30 watt brick with me if weight allows. Beacon will be KB1TX-2 (or is -9 correct for a mobil "rental car") when in the US and KB1TX/VE1-2 when in Canada. Computer will be a Compaq AERO running OS/2 with APRS75a (or latest version) when in the hotel or other housing. I probably will have APRS up in an OS/2 "window" on the computer using a roll-up J-Pole in the hotel's window when "home" so I can watch the local APRS activity. When in the Boston area but not on APRS I will be on the .64 Waltham machine, my old hangout when I lived in Plymouth and worked in Boston.

ITINIARY:
17 - Late afternoon, Denver to Boston to Belmont
18 - Belmont - Braintree - Plymouth - Belmont
19 to 22 - staying in Cambridge Hyatt Regency with trips to Newfound Lake area of NH and to the Weathervane in Salem NH for sea food!
23 - To Portland ME's Scotia Prince ferry in late afternoon.
24 - Ariving in Yarmouth NS in morning, to Barrington NS in afternoon.
25 & 26 Around southeast parts of NS - Shelburne to Yarmouth area, possibly to Halifax
27 - Yarmouth early in morning to catch Scotia Prince ferry back to Portland ME - I will have tracker on upper deck weather permitting!
28 - Quincy in morning then to Logan Airport in afternoon and back to Denver.

QUESTIONS:
1. Are there detailed maps of the east coasts of MA, ME, NH, and NS? Where? I just checked the "standard" ones that come up as part of APRS75a and they are not detailed enough. I found none for Nova Scotia.
2. 5.79 in MA, NH and ME?
3. ??? in Nova Scotia?
4. UNPROTO as Relay, Wide?
5. Beacon every 5 minutes when mobil or maritime?
6. KB1TX/VE1-2 (or -9?) when in NS?
7. KB1TX/MM-2 and KB1TX/VE1/MM-2 when on the ship? Ship icon?
8. There are 2m repeaters in Yarmouth and Shelburne NS that I have used in the past, but is anyone running APRS? Are there any digi's?
9. What have I missed?

```

I spoke to the Arkansas coordinator and he objected on the same grounds.
As an avid shuttle/MIR/Amsat enthusiast myself, I'll have to concur.

What is a good second choice for APRS?  He seemed willing to coordiante a
frequency statewide ...

I heard about this Gold Cart tracking system last week from a co-worker who is
also on APRS. He saw the show and it is located in of all places right here in
Palm Beach County, I think West Palm to be exact.

Sounds like a great but expensive idea but one person bought it, I am sure
others will be more receptive now. I am interested in tracking the OEM down
myself since we are in the 2-way business and I am sure my boss would love to
get into it, he is a GPS buff himself.

I had the same problem with my train trip, with the GPS-45, Pico Packet,
FT-470 Ht for the radio, and the laptop.

My first lash-up had 4-6 6' long cables, what a mess. You should of seen me
hooking it all up the first time in the front seat of the car. Wires
everywhere!!!

I ended up gutting a old FT-470 battery pack and used that as a junction
box. One power cable for the main 12V. The 470 got its 12V from the contacts
on the gutted battery pack. The pico was mounted to the back of the 470 with
velco. So a 6" cable came out the side of the battery pack to the Pico. The
Pico then had a 6" audio cable going into the top of the 470. The power/data
cable from the GPS-45 went into the battery pack. Power was made to the GPS
from inside the pack. The 45's data is another 6" cable from the battery
pack into the Pico. I was even able to have 2 fuses inside the gutted
battery pack.

So for standalone, there is one power cable to the radio/Pico, data/power
cable to the GPS-45, and the antenna to the 470. When I use the laptop, it
plugs into the Pico.

I all seems to work pretty good, and it has cut down on the number of cables.

Now I need to figure out how to hook it all up to my 45 watt old Kenwood
7850 radio. I may

cut the GPS-45 power/data cable and put a 5 pin din connector in line. Then
make up more cables to use the GPS, Pico and 7850 together.

With connectors and Velco anything is possible!

Randy

I worked on a project last year for a company that has patented a method of using DGPS to track the golf carts.

I thought it was too expensive to be useful, but their argument was that on the high dollar golf courses, if you speed up play enough to get just one or two additional rounds a day, the installation pays for itself in short order. It must be a good selling point, since they are selling the system. (I don't think they have quit the day jobs yet, though.).

```
They also were planning to put PDA's on the carts to allow the golfers to order beer and sandwiches.
The wait person would be able to take the order to the current position of the cart.

This issue of the ARCA trying to convince the coordinators of the states where 145.79 is already coordinated to APRS really stinks, folks! Some of us went to a LOT of trouble to get coordination and I, for one, don't want to see MY efforts be undermined by someone in another state! What are we going to do about this?

I agree that the 10 kHz deviation is a valid concern, but there are darned few radios that I've ever seen on packet that ever exceed 6 kHz at WORST! I think there's more to it than this "problem."

Who/what is ARCA, by the way? Who gave them the authority to tell us where, when, what to operate? I thought that coordination was a VOLUNTARY cooperative venture..

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

Mike's trip with APRS brought to mind my own "first mobile" experience in 1995 and I wanted to add a few remarks from my experience....

Mike noted his disappointment with the lack of activity in the OKC area. My particular trip (April '95) took me across Missouri on U.S. 36 and Illinois to Springfield. I didn't expect to find anyone on in northern MO, but I was even more surprised to find NOBODY in Illinois! I was, of course, heading for an APRS demonstration to the Quad Cities ham club after a brief stop-over in Springfield for the Gulf Mobile and Ohio RR Historical Society's Spring swapfest (I'm one of those RR nuts that runs APRS, too!)

On leaving SPG I headed north to Peoria, grabbed I-74 and ran on through Galesburg and into Davenport/Moline. The first activity I saw for the whole weekend was when I got within about 20 miles of MOL. My return trip home took me on I-80 to DSM then south on I-35 to MKC. Iowa was MUCH better once I got closer to DSM then I had fairly good coverage and posits almost all the way south into MO (thanks to N0BKB and his efforts!).

What's the point? Well, I'd like to suggest that we may wish to consider putting our heads together and gather a COMPLETE list of all active APRS digipeaters and gateways in the US and Canada and then hard-code them as labels with PHG circles, etc. Why? The purpose would be to provide a VISUAL directory of the APRS Network (note capitalization!) that all APRS users could bring up in short order.

NOTE TO BOB: The ONLY way to make it work on ONE map would be to greatly increase the number of labels available in one map to something much larger than the current 150... Otherwise, I suppose it could be done according to call area, regions or some other logical division of the continent!

I'll volunteer to gather the information and try to keep it updated. I'll even take some of the current regional level maps and add the labeling, too!

What do you all think?

The other purpose of my little oration is this: We seem to have a goodly number of groups in metropolitan areas now active. How many of these groups are working in conjunction with each other to put up intermediate digipeaters to cover major highways/interstates between them? We're doing it here in Kansas City and Iowa and we've at least fielded the idea to groups in Jefferson City and St. Louis (MO) and to a new group getting started in the Topeka/Manhattan (KS) area. We hope to get I-35, I-70 and I-29 covered in Missouri and eastern Kansas within the next six months!

Comments????? Please try to keep them civil (if that's still possible on the sig) because my asbestos suit has been confiscated by OSHA for abatement!!!

ONCE AGAIN!  I've seen no effort by any coordination group to get any other
group(s) to change recognition of APRS where it is already so recognized.
Nor, I might add, any attempt to discourage any group from so recognizing APRS
on a region-by-region basis where such activity is amenable to other users.
In other words, business as usual.

> I agree that the 10 kHz deviation is a valid concern, but there are darned few

I really hate to tell you, but I have observed radios much worse than 6 khz.
And worse than 10 khz.

> Who/what is ARCA, by the way?  Who gave them the authority to tell us where,
> when, what to operate?  I thought that coordination was a VOLUNTARY cooperative
> venture..

Beats me.  Who are you?  Coordination, while legally still voluntary, started
taking on the form of a "mandatory" participation over 20 years ago in the
repeater circles.  Today, the FCC looks for coordinated versus uncoordinated,
when resolving disputes and interference claims.  If a packet activity happens
to encroache on a recognized, band-planned occupant, and the FCC checks with
your local frequency coordinator, the uncoordinated activity will receive a
notice to cease and desist.

Why, oh, why are we still hearing this?  If you have received some form of
coordination or recognistion by your frequency coordinating agency or body,
rest easy.  If you have not, and you're receiving no response, then you've
possibly got something to worry about.  If you got a response, and it is not
what you'd hoped for, talk to the coordinator, and work with 'em to see if
there's a middle-ground that can be met.If you're whining without even having
talked to 'em, then stop wining.  I've heard enough.

For the record, there are several of us active on an internet correspondence
of coordinators.  We are, nominally, on your side.  A lot of the whining about
coordination issues to do with APRS manages to get from this SIG to that list.
It sure doesn't make MY life easier with those guys to try to defend silly
attacks by folks who don't, apparently, know what goes into coordination.

About 6 months ago, we had to call in water tankers to put out the flamewar
that erupted over the sudden recognition that AMSAT was, indeed, planning to
use the manned space subband that has been recognized for years.

Getting a nationwide frequency on 2 meters is *NOT* going to happen
gracefully.  Probably not at all.  And, geting all those rock-bound digi's
changed is non-trivial, either in actual tuning and hardware pain, financial
burden, or in getting Marden or International to make the rocks within our
lives.

> (Thinking now that perhaps I'd better call OSHA and see if I can put off that

You might want to see about getting some redundant disk space:  A lot of this
has preceeded your flamage.

Given the state of two meter frequency coordination in this country, I'd
say there would never be a single frequency that even half the country
would coordinate to APRS. The whole issue is extremely political. It
seemingly has less to do with appropriate use of the resource than with
getting and holding 'turf'. My personal opinion is to leave things as
```

they are. Most of the active LANs already are on a single frequency, and over time more will be able to come onto .79. I agree wholeheartedly that we do need to get a single frequency for 440 MHz before it is too late, grabbing a 1.2 GHz freq would be a good idea while we are at it.

As far as the space ops are concerned, I suspect they will move up in frequency once it gets operational. 145.79 is so crowded with stations they will experience too much QRM for it to be very useful while over the US, even with Bob's minimize command. The stated reason for using 145.800 (which places half the transmitted signal outside the satellite band recognized by the IARU) is to minimize QRM to the beacon from AO-13. Since that sat will hit the atmosphere all too soon, there will be room to move up. In any event, the QRM _to_ any APRS LAN will be minimal, a few minutes at a time serval times a day.

ARCA -- Amateur Radio Council of Arizona

The majority of Ham Clubs in Arizona are affiliated with ARCA. They are the recognized coordinating body in the state of Arizona. All-in-all, they do a pretty good job.

If you have a beef contact:

Ralph S. Turk, W7HSG
Chairman, ARCA Frequency Coordination Committee
5232 W. Calle Paint
Tucson, AZ 85741
(520) 623-1511 (w)
(520) 620-1309 (fax)

I believe Mr. Turk has a e-mail address, but it escapes me for now.

Dan Meredith, N7MRP, is the ARCA packet coordination committee chair, as well as being the Director of the Arizona Network Intertie Group. Dan is a good guy, who's gone out of his way to facilitate APRS. I would also like to mention George Poland (W8KFC?), who is the most vocal proponent of APRS in AZ, and Jerry Wyatt (N7QVU) who runs the APRS BBS in Phoenix.

We also have the Phoenix Packet Users Group, PUG, which has no dues, no by-laws, and no officers. We only have one rule: Buy your own breakfast (unless you want to buy Barney, KB7KOE, breakfast).

Arizona has many strong inter-club affiliations, with many people belonging to two or more clubs at a time.

Several Clubs share a newsletter. ADAW -- Arizona Desert Airwaves.

ADAW members:

Arizona ARC
Scottsdale ARC
Mingus Mountain Repeater Group
Central AZ DX Assoc.
TriCity ARC
Arizona Network Intertie Group
ThunderBird ARC
Ahwatukee Foothills ARC

Hope that helps. If you have any more ?'s about Arizona Ham Stuff let me know.

73,

Mark Fellhauer - KC7BXS
ThunderBird ARC Packet Coordinator

--------------------------
Actually (May get some flack again) read the rules for coordination as far
as the FCC is concerned. What you can do is gather all of your APRS users
together and have an election for a coordinator. Once a coordinator is
elected you attempt to work with the current so called coordination body
and if they are still hardheaded then just park yourself on that frequency
and call it a coordinated APRS freq. If you read the rules this is
perfectly legal. I did this here in North Alabama and the Alabama
frequency coordination group finally aggreed to grant the coordination
rather then fight a group of APRS users right to excersizing their own
coordinator. Ok fire away guys....

-----------------------------------------

I have to totally disaggree with this bull about coordinators beeing on the
side of a person trying to coordinate an APRS frequency. As a good example off
our friendly coordination council. I watched a Packet message scroll by my
screen one night on our local very unused 9600 Baud digi between the local
packet system BBS system administrator and the sysop. By the way the system
administrator was also the coordinator for packet activity. Anyway the sysop
stated to him that he needed 3 additional frequencies coordinated, and making
the story as short as possible. The coordinator stated to the sysop, no problem
```

you've got them. So like i stated before read the FCC rules for coordination!!.
I have to aggree with the person stating WHO ARE THEY....

This is strange because i always used to get this with 74e, but since
switching to 75a and don't have that problem anymore. Altough this may
be a PC system problem i don't know. To run 75 or 75a i'm having to boot
from a system disk since i don't seem to have enough of my 640 left to
run these anymore.

582. Re: [APRSSIG:7713] Re: On the Road with APRS

From: jack swift <jswift@up.net>
Date: Tue, 19 Mar 1996 08:49:07 -0500
To: aprssig@tapr.org
Message-ID: <9603191354.AA15902@btc1>
Rendered body type: text/plain

i do this sort of thing regularily as i travel arount the UP... although we
don't have many digipeaters available, i run HSP almost all the time. to
have room for the assorted equipment and antennas and cables, i usually use
my minnie-winnie.... i use the 'official' molex power connectors and have
lots of 'extrensions' and 'adapters', the most important one being a
'splitter' -- single male and two or three females. i have found that you
can wrap some velcro around the power cable adn then it sticks to the strip
of velcro on top of the dash or the equipment... i have so much velcro on
things that i had to develop a standard! -- hooks on top, loops on the
bottom. NOTHING SLIDES!!!

i also have noticed the constant streaming gps data problem, but thought
that the problem was that my timing was snafued. it seems that the gps is
gated into the computer for 7 seconds and then the tnc is gated for 2
seconds. i was fearful of losing the tnc data till i realized that the tnc
data was buffered..... however, it makes it very slow changing screens on
my dell 386-20 mono laptop!

The 'which maplist to use' is a problem that i ran into on my last wander to
St. Louis.. i had some great illinois maps in a separate maplist -- and
didn't remember until i was in the middle of a blinding rainstorm with 65mph
trucks on both sides and a blank map screen. i recommend pulling over to the
roadside when 'adjusting' aprs!!! if i had been more prepared, i would have
prepared a "maplist.now" containing all the necessary maps. of course, then
i would have had to learn how to prepare a maplist file that would work --
so far the docs haven't helped me integrate a single map into a regular
maplist so that it shows up when it should. i probably just need to study it
lots more!

in regard to the config file, i'd like to be able to start up the software
(after a lunch break on the road) and have all (ALL!) the settings be where
they were when i left them when i quit APRS. i have gotten accustomed to
which commands i always have to issue on startup, but it'd be nice to have
them saved (maps-features-xxx).

as another whimper, i noticed that when the data in a screen region changes,
the new data doesn't always completely overwrite the old data (i often see
"ing" in the upper right corner left from the word "drawing" when the data
changes). and if i update my position and change the comments, i have to
make sure that the new comments completely cover the old ones (blanks don't

```
count)....

as an aside, i think i will be making a trip down us141, (green Bay, WI)
i43, I94, (Chicago), (Kalamazoo, MI) on Friday 3/22 and return Sunday
3/24.... Unless otherwise notified, i will assume that everyone in radio
(digi) range is using 145.79.....  however, even if there are no station
heard and none of you hear me, having "MY" dot move along the map is
great!!!!!  i'd get the software even if i wasn't a ham because it's great
to see your position on a map while driving!!!

GREAT JOB, BOB!!!  my comments about 'problems' are not complaints, just
whimpering... if you want to see a real complaint, try taking the software
away from me!

WinAPRS Ver 0.2.6 was released yesterday, the announcment was made to the
WINAPRS mailing list.

It still does not work with Win3.1, The program runs properly but the
serial I/O still does not work. This is a high priority but I just cant
get it to work yet (problems with the DLL I have to write).

Mark

WB4APR REPLY COMMENT: Nothing personal, hi hi, but where have you been?
Once a month I put out a message asking folks to update DIGIEAST.bk and
DIGIWEST.bk At any instant you can do a FILE-REPLAY-DIGIEAST.BK and see
where EVERY reported digipeater is... IN THE WORLD...

Only one person has sent in a new digi in the last 6 months!

Gerry said:
For the record, there are several of us active on an internet correspondence
of coordinators. We are, nominally, on your side. A lot of the whining about
coordination issues to do with APRS manages to get from this SIG to that list.
It sure doesn't make MY life easier with those guys to try to defend silly
attacks by folks who don't, apparently, know what goes into coordination.

I am one of the "leakers". As the Frequency coordinator for Wisconsin I
would like VERY MUCH to find a nation-wide 2m APRS frequency. I can not
do it alone. MY point of view is that if we (the coordinators) do not
agressively try to solve problems such as this one - it will just snowball
and then we'll really have a mess. MOST of the coordinators don't have any
idea of the quantity of APRS activity - nor how it is growing. I've
been passing some of the messages over their remailer to educate them.
MY group, Wisconsin Association of Repeaters (WAR) does not coordinate
packet frequencies WAPR does that but I haven't seen anything from them
on the subject.

WB4APR REPLY COMMENT:  In my opinion, if you cannot get 145.79, then the
only alternative is down 5 KHz to 145.785.  That provides almost 20 KHz
separation from the SPACE frequency during Aquisition and gives 15 KHz
separation to existing users on 145.77.  But you will be waking a
sleeping "tiger" in the form of Buck ROgers, the editor of the Packet
Perspective column in CQ magazine..  who "manages" 17 nodes throughtout
the south on 145.77....  and adamantly will not accept a 15 khz neighbor.

While, I'd (personally) prefer to deal with the established coordination system
and work out compromises, Bill probably has a pretty good handle on the
situation in Alabama and his idea appears, at first glance, to be a logical
approach! (GAWD!  Did >I< say that?!?!?)

As I said in a private to Bill, with the use of APRS now experiencing a growth
spurt similar to the same growth that packet had about 10 years ago, it's
probably going to become a moot issue in the next year or two when everybody in
the US on APRS occupies 145.79!  It also seems to me that one of the motivating
factors might possibly be the flack that gets generated from the AMSAT SIG every
time somebody thinks that we're going to start digipeating through MIR, OSCAR,
etc!!!  You've all seen it, too!

There's even been flack over the new WeberSat digi usage and it's been given a
blessing!

```

How about Heathrow, London? Don't they get below 600 feet visibility all the time? Closed down, i guess.

How does GPS determine altitude so accurately - good enough for landing with no hands? (Cat IIIa.) Transponders and DMEs are not accurate enough for that purpose. (about 1/10 mile accuracy.) I'd think they would need something like Laser: Laser Altimeter instead of Radar Altimeter. How does GPS determine altitude?

I used to repair (crew chief for United Airlines) stuff like INS (Delco Carousel inertial guidance,) DME, transponder, ACARS, Doppler radar, etc.. but nothing on GPS.

II Morrow refused to sell me the _technical_ reference manual. They would sell the "operational manual," which doesn't tell much about the innards workings. Where can I find out more about HOW the thing works? I'd like circuit description; block diagrams; theory of operation, etc.. Where can I buy them? [I've flown c152, c172, c186, Archer II - fair weather weekend warrior.]

>
>APR REPLY: I find with the GO-HOME command or the GO-MAPS-UP/DN commands
>that I can recenter my self at any time, so the AUTOTRACK does not have
>to be on.... Just a tip...

Let me take this opportunity to thank you, Bob, for the surprisingly good operation in a hands-off mode. The map-switching issue (plus the startup thingie) was the only glitch in the works, and I think that's either solved or at least better in the newer maplists. It was my fault that I didn't "test drive" the route first.

However, "hands-off" is the main point here. It was a tough prospect to remember and key commands while tooling down the I-state at 75! About all that could be easily managed was single strokes for things like list viewing (and space bar for map updating was a godsend!). Occasionally I'd force an [X][P] report, but this was rare and only when I was seeing other APRS stations or I needed to see if the TNC went wacky.

I had the 200LX on top of the instrument cluster, and I left it folded down unless the map was needed or anticipated, or I was hearing station reports and wanted to see who was around. The map scale was never varied from 16-mile resolution. Autotrack was a must. Notable here was that [HOME], [END], [PAGE UP] and [PAGE DOWN] are two-finger shifted commands on the 200LX, which makes 'em impossible while driving.

Actually, that's a fairly important point for other compressed-keyboard PC's of my experience. These same "mass movement" keys are usually special shift functions in inconsistent locations, and never in the same convenient place as on regular desktop kb's.

Bob, N3OZB, writes -

<<I have visions of multiple power cords ... slowly strangling the people in

the front seat.>>

As did I. So I did a full-boat installation job expressly to prevent this problem. The TNC is attached to the radio (a Kenwood TM-251) and both reside in the space formerly occupied by the ashtray, using a bracket that I machined for the ashtray mounting points. Since the 251 has its data jack in the back, TNC-to-radio wiring is hidden. Power for both comes from the cig lighter leads, since that lived in the now-removed ashtray; those wires are also hidden.

Then I went overboard, and built a special patch/distribution panel that is permanently mounted in the dashboard fascia. It's attached to a wiring harness which interfaces the various elements, also hidden in the dash. The panel has receptacles for the GPS power/data cable (4-pin mic plug), the GPS antenna (SMA), my Doppler DF unit (8-pin mic plug), data cable for the HP (an 8-pin mini-DIN) and two 12VDC coaxial power jacks, one for the HP and the other as a spare. The GPS is mounted right next to the panel, and only has about 4" of leads to the panel, and the Doppler has only 6" of cable, too. The HP's data line (2 ft.) was made from 5-conductor ribbon cable, and I made a power cord from scratch out of #26 hookup wire, which I chucked into a hand drill to make twisted pair.

The sloppiest portion was the cables to the HP. Two feet was too much between the patch panel and the computer, which was attached with Velcro to the top of the instrument panel. So I had to fold-up the cables and tuck them under the Doppler head, also mounted with Velcro.

This all worked marvelously, though there was one receiver on the same 12VDC bus (an Icom R100, which I use with the Doppler) which didn't like sharing the power with the computer - there was a mild processor hash regardless of volume level. No amount of chokes and caps in the power leads of either the computer or the R100 would budge it. So for most of the trip I just ran the HP on the batteries and put its power cord away, which solved the hash problem *and* eliminated one too-long cable.

Eliminating the cig lighter created a problem with my wife, who wanted access to power for a couple of things she was bringing but was using infrequently. So I bought a single "add-on" accessory socket from RS and mounted it below the dash towards her side. Since it didn't need to supply cig lighter-level current, I just wired it into the same leads as the radio and TNC and let it go at that, adding a cap to hopefully reduce any hash her stuff might produce (a wise move, as it turned out). She was happy, it actually doesn't look too bad or tacky, and it never caused any problems with the radios.

Yes, I spent days putting all this together, but it certainly paid off in (mostly) trouble-free and non-aggravating operation during the trip.

592. GPS w/ PMap2

From: "Art Smith" <ALS@CEIS.UHCOLORADO.EDU>
Date: Tue, 19 Mar 1996 09:34:19 MST-0700
To: aprssig@tapr.org
Message-ID: <A83A047513A@ceis.uhcolorado.edu>
Rendered body type: text/plain

Last Sunday our local EOSS group in association with the Air Force Academy launched another high altitude balloon from east of Colorado Springs. I was at my home station SSE of Denver tracking it using APRS. I was taking the GPS lat/long data from APRS and transferring it to my "office" computer running Just SoftWorks Precision Mapping 2.0 and DeLorme's Street Atlas USA version 2.0 CD's to advise the ground "fox" hunters of what roads were under the balloon, especially as it came down. PM2 had lat/long capability, but was poor on showing the county's dirt roads. SA2 showed the roads, but had no lat/long capability.

On monday I called both companies to see if updates were available.

DeLorme's Street Atlas USA version 3 now has lat/long and apparently can search by lat/long. I have ordered an update. They do not have a GPS interface for non commercial use. Their commercial version is EXPENSIVE!

The CD Precision Mapping 2.0 from Just SoftWorks, Inc. has always had a menu item GPS, but it was not functional. Just SoftWorks will have a version 3 out in about a month (???) with updated roads. More importantly, they will have a beta version of their GPS interface up on their WWW site

```
available for downloading in a month (???).  Their site is
http://www.justsoftworks.com.

Now if I could just afford a color notebook computer with a
CD!  APRS is great, but a CD is needed to show ALL the
roads in an area.

Have I missed something, is there a way to transfer the
data from the SA2 or PM2 CDs to APRS for a selected area?
For example a 50 or 75 mile radius around Colorado Springs, with
an extension out to Kansas if a balloon fails to cut down
it's package.

>coordinator.
>

        Since some governments think we are a part of michigan (check the
map -- giggle), and others think we are in wisconsin (there are maps like
this, too), we had several frequency coordinators try to take us (the few of
us that there are) under their 'wing'. we 'politely' told them that we had
our own frequency coordinator elected by the UP Amateur Repeater Association
and a packet frequency coordinator elected by the UP Packet Association...
this doesn't mean that our coordinators are any less obstinate or that they
don't cooperate with all the other coordinators within radio range....

we just found that having a (relatively large) organized body of amateurs
willing to work within the (reasonable) system accomplished cooperative
coordination (and satisfied both the FCC spirit of the law and the
reasonable needs of the affected amateurs)....

Subject: [APRSSIG:7720] Re: APRS coordination in AZ

Who/what is ARCA, by the way?  Who gave them the authority to tell us where,
when, what to operate?  I thought that coordination was a VOLUNTARY cooperative
venture..

Best 73,
Jim Duncan, KU0G

<----  End Forwarded Message  ---->

I have asked this before and got no response, I agree with Jim is PACKET
COORDINATION not VOLUNTARY ?? I know that repeater coordination is somewhat
voluntary but if QRM is a problem the coordination group can give the
coordinated repeater preference and then if nothing is done this can be upheld
by the FCC.

I am really interested in finding out for good if a Packet Coordination group
can MANDATE usage of a frequency.

>Would be interested in hearing comments regarding the PacComm Pico Packet

I finally got a chance to play with a Pico-Packet with a GPS built-in
recently!

I LOVE THIS UNIT!!  It makes it so that MacAPRS/WinAPRS thinks there is two
```

serial ports (I customized some code for it) and everything works great!

There is one thing to be aware of.

MacAPRS/WinAPRS/DOS-APRS all need to have HEADERLN OFF...

In MacAPRS/WinAPRS, there is a possible problem to be aware of...

If you goof and have HEADERLN ON, !-AND-! receive somebody else's GPS packet,
the software will think the GPS data came from you.. and therefore, move
YOUR position on YOUR map to where the OTHER station is..
Fortunately, as soon as you get another GPS string from the PicoPacket, you
will be moved back..

MAKE DARN SURE THAT HEADERLN IS OFF!

601. Re: [APRSSIG:7625] Re: GPS for landing planes

From: Terry Taylor <a010717t@bcfreenet.seflin.lib.fl.us>
Date: Tue, 19 Mar 1996 20:11:50 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.3.89.9603191950.A28005-0100000@bcfreenet.seflin.lib.fl.us>
Rendered body type: text/plain

Without diving (er, climbing) too far off the APRS trac, and from
one qualified in CAT III landings, the aircraft must land using the
autopilot, autothrottles, and autobrakes (if operable on the MD-88). CAT
IIIa goes down to a RVR (Runway Visual Range) of 700 feet, CAT IIIb to
600 feet, and (I believe) CAT IIIc of 300 feet. Presently, to my
knowledge there are no CAT IIIc approaches in the US. In order to fly
such an approach, the entire crew must be certified, the aircraft must be
certified, and the approach procedure must be published for CAT III. If
any of the required equipment on the aircraft is inoperative, then a CAT
III must not be attempted. An aircraft can be landed manually under CAT
II conditions, RVR 1200.

Back to APRS.

```

From: Bob Bruninga
Sent: Monday, March 11, 1996 6:36 PM
To: Dave Guimont
Cc: amsat-bb@amsat.org; aprssig@tapr.org
Subject: Position tracking via WO-18

Dave asked for the BPSK uplink frequency for the WO-18 digipeater, presumably to try to digi an APRtrak position report like we did with SPRE. If WO-18 is going to operate continuously in digipeater mode, then this satellite could be the basis for world wide amateur mobile vehicle position reporting.   The 1200 baud BPSK uplink is 145.900.

The AMSAT APRtrak software will plot the position of any stations that digipeat their position and status in one of the following formats:

W3ADO>FM19SX,WEBER-1:Hi!

Here your position report uses your 6 digit grid square in the TO field. This packet is only about 1/2 second long and permits the maximum number of vehicles or stations per pass probably close to 200 or more. It will place you within about 2 miles of your QTH and include any status or comments on the end.

The more precise format allows you to transmit your symbol character so that your type of vehicle or station will appear on the map. It takes longer, almost a full second.

W3ADO>APRS,WEBER-1:@141329h3859.11N/07629.12W>Enroute Europe

This format is the time, an "h", then the LAT/LONG, and the final character is one of 126 different symbol characters followed by any comments. The symbols can reperesent all maner of vehicles, trucks, cars, boats and aircraft.

If you are running the APRtrak software, it will automatically transmit your position. Be sure you are using a satellite BPSK modem, WO-18 has no mechanism for noremal terrestrial AX.25 FM signals.

Rendered body type: text/plain

To stir up more interest in the Chicago area, The Northern Illinois APRS Net (NIAN) will be sponsoring an HF/VHF net on Sunday March 24 at 2100 UTC (3pm CST).

PROCEDURE: Transmit name & QTH to WB9WOZ
When (and if) you get an ACK back, consider yourself checked in.
HF and VHF station are encouraged to participate.To keep QRM to a minimum place N9RER-15 after GATE so as not to tie up other VHF nets, VHF stations should send only once or twice (you may not get an ACK).
Show your support for aprs by checking in. I will post check-in totals and calls next week.

A net like this was held at the end of January. It was quite successful on the VHF side, but HF did not cooperate and 30 meters died a couple of hours before net time. Afternoons seem to be good for HF and also there seems to be lots of stations on the air on sunday afternoons. I received email from quite a few of you HF guys who tried, but couldn't get in due to band conditions.

NIAN would like to make a net a regular weekly feature. With the start of the severe weather season, we could all use the extra practice.

```
I looking forward to seeing many of you on the screen.

Thanks and 73's
Bruce Tobias, WB9WOZ
```

I've recently acquired a Sony SLV-940HF.  It has the autoclock feature.
The correct time came up as soon as it was plugged in.

The manual explains that the VCR receiver scans all of the TV channels
until it finds one transmitting the time-of-day.  Frequently that service
is offered by PBS channels.  Here in South Florida it is carried by
WPBT-TV channel 2.

In a message dated 96-03-19 22:45:33 EST, you write: (Keith Sproul)

>I LOVE THIS UNIT!! It makes it so that MacAPRS/WinAPRS thinks there is two
>serial ports (I customized some code for it) and everything works great!

Keith, I received a Pico Packet on Monday and havn't gotten it to work yet. Maybe you have some insight to what I am doing wrong.

I have the basic unit without the 2nd port set up as a stand alone tracker, the settings are as follows-

```
MYCALL-    N2OOC-1
GPSTEXT-   $GPRMC   (GPS-45)
LOC        -   EVERY 2 (20 SEONDS FOR TEST)
BAUD PORT 1- 4800
BAUD PORT 2- 4800
GPS- ON
```

Now it sends my call sign but is always waiting for GPS, here is what it looks like.

```
N2OOC-1>GPS,NOCALL:WAITING DATA FROM GPS
```

The GPS is sending OK. The TNC is connected to the RADIO OK or it wouldn't send MYCALL.

Am I missing something?

73 de Joe N2OOC

Keith - two questions

Will the WinAPRS map CD, that you will release at Dayton, include the area
maps of each of the area map coordinators and mapmakers? John Baum,
KB8JXO; William Nolle, KE4EER; Bob Bruninga WB4APR; Mark Sproul KB2ICI;
Keith Sproul WU2Z and others that are not at the tip of my tongue
(fingers).

Will it be the type of CD that DOS/Windows as well as MacAPRS people can use?

It will include ALL DOS Maps I can get my hands on...

>
> Will it be the type of CD that DOS/Windows as well as MacAPRS people can use?

The MacAPRS/WinAPRS maps are the EXACT SAME!... So no difference..

The DOS/PC APRS maps will be there too (see above)

The CD will be in ISO-9660 format which means ANY computer can read it even
UNIX machines...

>
> Bill KE4EER

Okay, Bill, grab that fire extinguisher.

This little piece of soap-box lawyering will serve no purpose other than to
make your "coordinating" body look overtly stupid. Further, there is now case
law in California (where else!?!) that recognized the original, and still
responsive, coordinating body over the start-up designed to merely get what
they wanted. What you did was stupid. That you achieved your goal because of
your move is sad, in that it makes the job of those of us trying to do real
coordination harder.

SO: Just where do you get off thinking you can just make your own group and
userp the work and history of a group that's been doing the work and taking
the heat for years, just because they won't do something exactly as YOU
thought you wanted it?

Sadly,
Gerry

PS: Is there *ANY* interest in some of us trying to work within the
coordination community, or would the majority prefer to go off willy-nilly and
occupy frequencies with packet regardless of other users (THAT is called
interference, by the way...)???

A GPS receiver correlating code and carrier phase, and receiving data from 2
or more pseudo-satellites (pseudollites) could have the vertical resolution
necessary.

> I used to repair (crew chief for United Airlines) stuff like INS (Delco
> Carousel inertial guidance,) DME, transponder, ACARS, Doppler radar, etc..

> warrior.]

Get on the WWW and do a search for Navtech Seminars and GPS bookstores. Find
a copy of ICD-GPS-200. Read it (there'll be a test on the checksum
manipulations later in the hour). Then get the RTCM technical specs and learn
about differential correction. These are the two big references.

Gerry

> I am really interested in finding out for good if a Packet Coordination group
> can MANDATE usage of a frequency.

A lot of folks are interested in this. About 13 years, ago, several of us
did, in fact, try to get some degree of organization going on Packet. The
coordination effort, then, was a dismal failure.

the thrust was to equalize resources, and perform some spectrum utilization
management. The typical response was, "It's MY TNC, I'll put it where I want,
running however much power I want to run."

Oh, and simply asking for a rough Lat/Lon literally led to some instances of
death threats.

Outside of some individuals with a clear concept of a network plan, and some
few clubs with a similar idea, little real planning or coordination has been
done with packet. Obviously, recognizing a few exceptions out there...

Packet has historically been granted frequencies (subbands) from the analog
coordinators for packet use. In return, the coordinators do not put any
anaolog operations there. Since the effort exceeds mere repeater location
coordination, but extends to band-use planning ans spectrum management, it's
not always trivial to grant Packet some more of that precious band. But it is
expected.

Wish there were a simple answer to your question.

Keven...
        Try TV stations...best bet is PBS..  Our local PBS station sends
out the data, but is about 2 minutes fast (government cutbacks,
Republicans, and other excuses).  They say accuracy is a priority with
them, but it hasn't improved in the last few months

Is there any way to have a tnc change the gps data into the six digit
gridsquare format???
Gwen any help hear this is what we realy need to do this thing right.
A PSK or what ever it is tx only tnc with a conversion format that
changes the nema string into the EM83hw format.  BUT it should only be
a comand there may still be some situations where you would not want
to do this.
```

.
r
Bob and others i had another thought about this how about a
microprocessor controled unit that could have 12v relays in it or
something that could wake up the gps first say 15min b-4 the pass
then wake up the tnc and radio 5 min b-4 the pass in this way the
interference is reduced to the sub-band but the elements could
be a bit old and still give the staion a beter chance with old elemnts.

if this and the special tx only tnc could be in one "plug and paly box"
this would be the way to get it rock'n and rollin

I realy like the timeslot plan but i just had one idea make sure to
reserve some slots for cross continental travlers like w7lus-14
"we never know where he is going to show up!!!" :)

Rendered body type: text/plain

```
Day 1 on WO-18:  I copied probably 10% (about 2 screens full) of packets
                 using manual tuning (VERY HECTIC).  COnvinved me it was
                 worth doing.
Day 2 : COnfigured for automatic receiver up/down tracking....  COULDNT
        get any packets.... Later discoverd that 12 volt car battery on
        roof that powers Power amp and PRE-amps was down to 4 volts!  So
        this was a lost day..
Day 3 : Fixed battery.  Got good AUTOMATIC tracking/tuning of LU-19 and
        received several packets.  But still couldnt get lock on WO-18
        lots of audio and 6 S units above the noise, but no usable packets.
        The tones just sound sick..
```

I have heard that WO-18 downlink is kinda sick. Is it worth trying to
decode, or have I just chosen the wrong 2 days for my first attempts at
WO-18? If anyone has worked WO-18 recently and longer than my 3 days of
frustrating experiences, please lemme know if im barking up the right
tree? Thanks...

625. APRS Torch tracking via SAT

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 20 Mar 1996 21:58:44 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960320214306.17242E-100000@greatlakes>
Rendered body type: text/plain

There is another possibility for satelite tracking the olympic torch.
(and for testing GPS precise time for quadrupeling channel throughput).
We will need to test this on a LIMITED basis. I need a cadre of volunteers
interested in experimenting, Maybe one day a week or maybe only ONE PASS
or who knows... I need a list of available resources. If you fit the
following criteria, lemme know.

1) Uplink: 2m FM mobile, 35 watts or more (with GPS)

2) Downlink: 70 cm FM rig

3) Are you availailable for passes (with equipment)?
    1) During working hours? (it may only ba available in sunlight)
    2) During evening Hours?

```
    3) DO you have access to a satelite tracking program
        (does not need to be mobile....)

Vehicle doesnt have to be moving.  Parked with good horizons is fine.

Keep this request relatively low key.  I was amazed that almost all
responses I got from the AMSAT-bb posting of our WO-18 experiments were
emotional and AGAINST APRS position reporting.  Where has the
experimental spirit in amateur radio gone?  I guess most of them are
here...  Of course, can a choir sing?
```

We will have an APRS booth at the Timonimu Hamfest the last weeekend in
March just North of Baltimore Maryland.  We will have lots of MIM cards.
FOr those who have heard it before...
    These are complete TNC XMTRs on a single CHIP.  They output PTT and
    AFSK tones ready for any transmitter..  THey transmit any of the
    following at any periodicity:
       BEACON
       POSIT (if attached to a GPS)
       TELEMETRY (5 analog channels, and 8 bits)
       CW-ID

This latest verison has full 8 hop digipeater field capability, and can
now be programmed with ANY APRS symbol.  SOrry, the first models all came
with the big blue DOT...

The MIM is alive an well..
The MIC encoder is right behind...  SOrry for the year of promises....
```

> coordination harder.

Now Gerry i didn't call you stupid!!. Just because i found a legal way around
that group that it's on;y interest is to provide frequencies for friends and
those people that already have coordinated frequencies. Believe me when i say
it's not the great coordinating body you speak of. I take it that this is hitting
you hard simply because you are one of them that think you should be lord and
master over who will or will not get a coordinated frequency. I didn't break
any rules, but rather used the rules to get what WE where after. Before i did this
i attempted to follow your rules and all i got was flack and closed doors!.
After i did take the path i did the frequency coordinating body finally did give
me the official papers i asked for in the first place. So Gerry i do have papers
stating 145.790 is a coordinated frequency. Just to explain a little about your
coordinating body's and the fine job they are doing, in most cases this may be true
but not in Alabama. They started to place packet BBS's and digi's on the few
simplex frequencies that are left in this area untill i told them i would park
myself on those frequencies and talk to anyone i could reach with my system in an
attempt to gather signatures to prevent them from doing this, guess what it
worked and we still have our few simplex frequencies no thanks to the so called
coordonating body in this area of North Alabama.

>
> SO: Just where do you get off thinking you can just make your own group and
> userp the work and history of a group that's been doing the work and taking
> the heat for years, just because they won't do something exactly as YOU
> thought you wanted it?

Well Gerry take the time to research the fact that what i did was strictly following
all of the FCC rules pertaining to coordination even tough some may disagree with
it because they feel that the so called coordinators should controll who should get
what frequency even tough there are many hams that wanted that frequency. Gosh
Gerry wake up it's done everyday not just with amateur radio.

Sorry you disagree with my method but when following your rules got me nothing
but flack and harrassment i researched the rules and followed them.

>
> PS: Is there *ANY* interest in some of us trying to work within the
> coordination community, or would the majority prefer to go off willy-nilly and
> occupy frequencies with packet regardless of other users (THAT is called
> interference, by the way...)???

Call it what you want it but as i see it i have a legal coordinated frequency as
i have the papers to show that i do. Guess who the FCC would side with. So the
fact is if you want to call it interference that makes you rather stupid i think.
I didn't want to start this type of sig posting again but i will not stand by
and let someone call me stupid because of my opinion, i think pretty low of a
person like that.

Rendered body type: text/plain

I have had the Garmin 45 for about a year now, and I had a question, when I wired up the connector to work with my TNC, I thought the white wire (Data Into GPS) was not needed, and I found that to be true cause the KPC-3 doesn't have to initialize the GPS. But i am learning that I can use this GARDOWN software and i am told you just unplug the kpc connector and plug it right into the computer serial port? Now I think I need this white wire hooked up to some PIN on the DB25, need some help on this.... Where does this wire go, and what mode do I put the garmin in when using with software?

I got my copy of NMEA-183 Ver. 2.0 from Navtech GPS Store (703-931-0500) about a year ago for about $80. I was disappointed that it was essentially a Xerox copy of the spec (complete with someone's scribbled notes) in cheap bindry. I believe Ver. 2.01 is out now for about $10 more.

Good Luck-

>> How does GPS determine altitude so accurately - good enough for landing with
>> no hands? (Cat IIIa.)

>A GPS receiver correlating code and carrier phase, and receiving data from 2
>or more pseudo-satellites (pseudollites) could have the vertical resolution
>necessary.

GPS and DGPS determine a GPS user's instantaneous position in 3-space based on solving propagation-delay equations for observable satellites; i.e., using the observed "simultaneous ranges" to at least 4 space vehicles (SVs) currently in view. The center of the earth can be substituted for one of the SVs if the user's "altitude" is known by some other means. But notice that is the user's altitude above the center of the earth, and not above the local terrain, that is being used in this context.

The problem with using GPS or the differential version of it (DGPS) for the height dimension in a aircraft landing system is that the model for the earth's elevation immediately below the aircraft's descent path to the runway, and within its landing zone, must be quite accurate, as well as for below its go-around path in case the approach is aborted before touchdown.

That's why most GPS and DGPS approaches in use, or being defined today for runways without an Instrument Landing System (ILS), use GPS or DGPS to create a horizontal reference to follow and then rely on, say, barometric altimetry referenced to local air pressure at the surface (i.e., the "altimeter setting") and the airport's published elevation to create the vertical reference above ground.

Can't get to Cat III that way, but you can get an equivalent Cat I approach that way (minimum 600' ceiling and 1 mile forward visibility).

>LOC        -   EVERY 2 (20 SEONDS FOR TEST)
>BAUD PORT 1- 4800
>BAUD PORT 2- 4800
>GPS- ON
```

Was that with or without the 2nd serial port? If it is with the second
serial port then the switch setting should have two positions one position
powers just the TNC and the port for the computer hookup the other on
position powers both serial ports.

>From one of my previous postings with WX station changes for GPS in ( )

```
        Here's the setup I'm using to run my U2000 with the PicoPacket TNC
two serial port.
U2000 in datalogger mode
[!!000000C501660000281B02AA--------004403BB]

TNC settings as follows
gpstext !!  ($GPRMC)
[string to recognize]
lpath aprs v relay,digi1,digi2,digi3,wide       [digi path for wx data]
loc e 30
[becon wx string every 5 min]
b e 30
[becon btext every 5 min]
BText    !4156.45N/09142.42W_                [postion format forstandalone WX]
             (whatever you want in this case)
unproto aprs v relay,digi1,digi2,digi3,wide  [digi path for becon data]
uimode on
[seemed to be the secret trick]
mya relay                                                              [so
you can still relay]
```

Plus the normal stuff like my, myp and so forth. I use an rs232
cable that has two rs232 connectors per end, so it can pass through data on
both ends. With this cable I can still us my Peet Bros datalogging software
as well as transmit WX data in the APRS format. Special thanks to Bob for
his patience in not pointing out my stupidity (it's all in those readme
files he wrote) and to Paul at Paccom for the firmware EPROM chip he sent.

Also on a 2 port Pico it does make a differece which position the
switch is in, make sure it's the left on position, looking at the back, and
not the right on position.

```

I bought a copy of the NMEA-183 spec directly from NMEA abt two years ago
(when I first got my GPS receiver). If I remember correctly, the cost was
$25 + shipping and handling.

I do not know the address off-hand, but I'll get it and post. Mobile, AL is
what i remember.

Hi folks.

To help Keith out a little.  I would suggest anyone interested in the issues
on this move this debate over to regional_freq which handles these issues.
Dan Puckett, K5FXB, is the SIG Chair.

Also, Gerry, the Texas Packet Radio Society, form the out set never proposed
coordination but proposed managment and band planning.  This can be tracked
back to the first President Tom McDermott, N5EG, through myself and now Dave
Wolf, WO5H.

If people are not aware, the NFCC (National Freq Coordination Council) is
trying to get off the ground by brining all the Freq Coordination groups
together.  There are som ehighly charged issues here and I am sure more
info will be made available on regional_freq.  The name selection alone is a
possible indication ?  The interesting note is that there charter, from
twhat I have been told<, does not stop with repeaters, but wnats to cover
all 'systems' that repeat information and HF as well.

If you are a TAPR member, my next PSR President Column will have a rather
interesting discussion of paradigm shifts and how making rules now is going
to potentially stifle our growth.

Anyway -- swtich the thread over to regional_freq as a suggestion.  I am
sure Keith would prefer to keep APRS technology as the focus.

Cheers - Greg, WD5IVD

>
> I am really interested in finding out for good if a Packet Coordination group
```

> can MANDATE usage of a frequency.

A lot of folks are interested in this. About 13 years, ago, several of us did, in fact, try to get some degree of organization going on Packet. The coordination effort, then, was a dismal failure.

the thrust was to equalize resources, and perform some spectrum utilization management. The typical response was, "It's MY TNC, I'll put it where I want, running however much power I want to run."

Oh, and simply asking for a rough Lat/Lon literally led to some instances of death threats.

Outside of some individuals with a clear concept of a network plan, and some few clubs with a similar idea, little real planning or coordination has been done with packet. Obviously, recognizing a few exceptions out there...

Packet has historically been granted frequencies (subbands) from the analog coordinators for packet use. In return, the coordinators do not put any anaolog operations there. Since the effort exceeds mere repeater location coordination, but extends to band-use planning ans spectrum management, it's not always trivial to grant Packet some more of that precious band. But it is expected.

Wish there were a simple answer to your question.

Previously I announced the availability of a small GPS antenna from PacComm. There have been numerous requests for specifications. Here they are. To recap, these antennas are available from PacComm for $50 plus shipping. Delivery may take up to 2 weeks after order is placed.

Call 800-486-7388 to order.

73,
Gwyn Reedy
PacComm

New Miniature GPS Antenna from Trimble Navigation

Trimble's OEM Products Group announces a miniature GPS antenna for use with the SVee6-CM3 receiver. The new antenna featurs a 25 dB LNA, small size (47 mm x 40 mm x 13.3 mm, 180 gms.), magnetic mounting, and a 5 meter cable. This weatherproof antenna is designed to operate with or without a ground plane and includes filters for improved jam immunity. List price is $75 when fitted with an SMB connector.

Total specification (through antenna, LNA, cable, and connector)

Frequency Range	1,575.42 +/- 1.023 MHz
Gain	23dBi MIN (on 65 x 65 mm ground plane, -40 to +80C)
Noise Figure	1.6 dB MAX (+23C) 2.3 dB MAX (+80C)
Output Impedence	50 Ohms
VSWR	2.0 MAX
Out of band rejection	+/- 20 MHz 7dB MIN +/- 30 MHz 12 dB MIN +/- 50 Mhz 20 dB MIN +/- 100 MHz 30 dB MIN

>any one have info/knowledge about that?

Some of the new Audio/Video consumer receivers (Denon "Pro-Logic" in particular)
can demodulate the RBDS (Radio Broadcast Data System) subcarrier which is now
transmitted by many FM broadcasters, including WPLY in Philadelphia where I
handle the engineering duties.  This scheme, based on Europe's RDS, uses biphase
PSK at 57 kHz and deviates the main carrier about 2 kHz (about 2.7% of the total
deviation of 75 kHz).  In addition to providing time of day, the RBDS signal can
send the station's call sign, program format, traffic report information,
paging,  alternate frequency data and a 64 character text string -- we transmit
the title and artist of the song currently playing.  Some stations are sending
Differential GPS data, sold by "subscription" by DCI to users.  If you want more
information on RBDS, check the WPLY web site, http://www.y100.com -- it's under
"Station Information" and "Technical Information".

I'm presently working on a means to get a GPS receiver to talk to my RBDS
encoder, so that its internal clock can be automatically synched to the time
data provided by GPS.

```
>I have had the Garmin 45 for about a year now, and I had a question, when I
>this wire go, and what mode do I put the garmin in when using with software?

The Software should tell you when to use what
 Garmin/Garmin to up/down load routs/tracks information
 NEMA/NEMA when you want to see live position data

I use MacGPS and MacGPS PRO but same Idea,

 ### From the Garmin-45 internet  FAQ  version 1.0.7  ###
 ###       120 K of information you should read        ###
```

and I would be shot if I uploaded it to the APRSSIG :-)

-How do I interface the GPS 45/40 to an computer?

		IBM-PC compatible		
Function	Garmin color*	DB-25 socket	DE-9 socket	GPS 45
--------	------	-----	----	
Data in	White	2	3	Data In (White)
Data out	Brown	3	2	Data Out (Brown)
Ground	Black	7	5	Ground (Black)
power in	red	N/A	N/A	(for ext. power only, do not forget to add a 1/4 Amp fuse!)

The standard RS-232 connector is a 25 conductor DB-25, although many PCs (and some other equipment) now use a 9 pin DE-9 (often incorrectly called DB-9)

Serial Port Connections

Computer (DTE)				Modem
DB-25	DE-9	Signal	Direction	DB-25
2	3	Tx Data	->	2
3	2	Rx Data	<-	3
4	7	Request to send	->	4
5	8	Clear to send	<-	5
6	6	Data Set Ready	<-	6
7	5	signal ground		7
8	1	Data CarrierDetect	<-	8
20	4	Data Terminal Ready	->	20
22	9	Ring Indicator	<-	22

For NMEA-0183 interfacing, we are only concerned with Rx Data, signal ground (and possibly Tx Data, if we want the computer to talk to the GPS)

>From the Mac to Garmin FAQ

Macintosh:

GPS 45	Macintosh
Data Out (Brown)	Receive Data (5)
Data In (White)	Transmit Data (3)
Ground (Black)	Ground (4)
Power(+)(Red)	No Connection

Serial Port

The PowerBook 520 and 540 computers have a standard Macintosh serial port for synchronous, asynchronous, or AppleTalk serial communication. The 8-pin mini-DIN connector on the back panel is the same as those on other Macintosh computers.

Ron,

My Garmin owner's manual shows that the white cable is data_in and the brown cable is data_out.  It will
 depend on the connector you are using as to which pin they go to.  I don't have the diagram in front of
 me, but I think they go to pins 2 and 3 on the 25 pin serial connector.

Good luck.

This is what I'm looking for...INPUT. Excellent idea. Several heads are
better then one.
I think your idea is definitely better.
For those who have inquired, the local Chicago area will be on 145.79 MHz.
Other stations outside of our area that need to GATE (from HF), or GATE,GATE
(from far away VHF), PLEASE add N9RER-15, **NOT WIDE** after last GATE so we
dont tie up other nets cross country. That way you will digi into the Chicago
net only. (I hope I got that right Bob)

I'm open for comments,questions,etc. Remember, we at NIAN want to make this a
regular weekly net.

650. Last Call for Maxon Transmitter

From: mark.endicott@nashville.com
Date: Thu, 21 Mar 96 17:40:12
To: aprssig@tapr.org
Message-ID: <199603212353.RAA26412@tapr.org>
Rendered body type: text/plain

** LAST CALL FOR TRANSMITTERS **

I HAVE AN OFFER TO PURCHASE ALL OF THE REMAINING TRANSMITTERS.
IF THERE IS ANYONE OUT THERE THAT WANTS ONE CALL ME SOON. ALL
UNITS THAT I HAVE CHECKS FOR HAVE BEEN SHIPPED AS OF 03-21-96.

Edited text of original post follows:

I have run across a very small quantity of Maxon VHF Data
Modules that I would like to make available to the APRS
users on this SIG. They are the DT-0510 model, TRANSMITTER
ONLY VERSION. These are brand new units, however they were
bought surplus from Maxon in liew of warranty. Maxon has
discontinued this model but they are still making the TX/RX
version of the same unit. When these are gone there will be
no more. This transmitter is rated 5 watts, and is capable
of 9600 baud (not tested). They are supplied configured for
2 watts output and are on a test frequency near 151 Mhz. We
have been using them on 145.79 (1200 baud) here as APRS
stand-alone trackers here with great success.

Specifications:

Size: 2 3/8w x 4 3/4l x 3/4h (all metal housing)

```
Power: 10.8VDC @ <1 A @ 5W, <.6 A @ 2W (14 V could toast it)
Inputs: DB9 ,( Power p.5) (Ground p.4) (PTT p.3)
        (Audio {data} p.1 @ 250-350 mV adjustable)
Output: BNC Connector, 50 Ohm
FCC:  Type Accepted for Commercial Service.
```

Included with each unit is basic technical information and how to modify them for 5 watts. (one jumper) Tune up on 145.79 has been very straight forward with no problems or component changes required, just install the crystal and tune up. Some of the units tested have not put out the full 5 watts, at 145.79 but all have been at least 4.5 W at 10.8 VDC. Crystals are readily available from most suppliers, specify for Maxon CP-0510.

If you want one, send $40.00 plus $2.75 for UPS to me at the address listed below. If you need more information please e-mail me, direct only, or call (800) 431-2929 M-F 9-4:00, ask for Mark

mark.endicott@nashville.com. WB0NOO

Ron- it goes onto the pin of your computer's RS232 connector that has TX data out.
Tha GPS45 is put into Garmin-Garmin mode for use with Gardown7.

Gardown7 is a nice little program, but remember to direct its output to a file or something. It doesn't just "come up on the screen", it is just the I/O routine

No. You misused a description of a mechanism to define a new group in the event that another is not performing its function.

What you did was get your feelings hurt, and try to open your own coordination group.

I cannot speak to whether the coordination body in your area is functioning appropriately, or not, but I can state that at least in Texas, and a large portion of the country, we are self-policing as are MOST hams. And we tend to go out of our way to do a good, unbiased job.

Since you obviously do not know the history of how packet got its frequencies, there's little I can do to enlighten you. Suffice it to say, packet is a new mode. Coordination has ben occurring around the country since well before packet even thought of appearing. Someone had to cede frequencies to give packet a place to start and congregate.

> Well Gerry take the time to research the fact that what i did was strictly following

I did not really intend to call you, specifically, stupid. I can infer, from your actions, a general disregard for normal procedure and a preference to disrupt rather than attempt to work within an established structure. I apologize if I called you something you'd prefer to not see.

Well, I'd say that pretty well shoots down the idea of 145.77 or .785
then....Anybody have any other ideas?  What about 144 MHz?  I know that locally
we have activity on 144.91 through 145.09 on each of the 20-kHz channels
allocated.  Is it possible to drop below into the 144.80-.89 range?  Admittedly
I'm just not up on current allocated channels or "gentlemens agreements" any
more since I've gone to operating practically 100% APRS packet mode (except for
the BBS on 145.09 here...)..

Could someone enlighten me/us?

BUT YOU DID CALL ME THAT, yes i do have a disregard for groups (Or individuals)
that think because they have been hams for a long period gives them a right to
dictate what frequency should be coordinated to what. Wake up Gerry i didn't do
anything that was not according to any FCC rule, i just used the rules for our
benefit (Perfectly legal). Listen Gerry i tryid it your way and it didn't work
don't you understand that?. My way did work and you say that makes me stupid!.
And again i will make the statement that if you are having problems getting a APRS
frequency coordinated and the local coordination group doesn't even want to discuss
the request gather all the APRS users in you area and elect an APRS coordinator and
first attempt to work with the so called legal coordination group, and if that
doesn't get you anywhere park yourself on an unused frequency and call it rhe
coordinated APRS frequency in your state. I am NOT suggesting you do this before
you attempt to do it trough your area coordination body, but if they are as they
are here then it's a way out.

Some of this coordination discussion is interesting, most of it contains way
too much flameage and should be taken off the net and done by private e-mail
(praise in public flame in private).

It seems to me that we should do what we can to keep the psudo standard of
145.79 on the 2m band where we can and start looking at other bands for
9600baud or hybrid1200/9600baud frequencies now. Something in the 1.25m and
70cm bands before they get too crowded. I would think our energies will be
better spent in this direction. I know that 220 radios are hard to find but
more the challenge.

I feel very strongly that "your way" makes life much harder for those of us
who have to try to maintain the "system." That there are APRS users and fans
within the coordination community could help. Hearing that someone "just set
up their own" coordination entity because they didn't get an answer they
wanted, makes the job of convincing the established community that APRS is not

a bunch of shhot-from-the-lip folks considerably more difficult.

Creating a competing coordination group makes everyone's life harder. Tell me, what are you going to do when someone comes to you for a repeater coordination? Or, an ATV repeater coordination? Did you participate in the St. Louis meeting where most of the coordinators (those who could be identified and notified, including the California splinter groups) were invited and a majority attended? Have you seen what has gone into developing the requested Single Point of Contact with the FCC?

A more acceptable approach, if you did not receive a reasonable hearing at the coordinator is to appeal it to their board of directors and/or their membership. A well reasoned appeal, absent the vitriole, usually works better than a frontal assault on the work they have been doing, something that seems important to them. Recall that one of the things that makes this thing a hobby is the various things one can do. If someone sees a burning need to help organize repeaters, packet, etc., and works within the normal channels, it can be very rewarding. It can also be a real pain.

Dave,

Are you listening?

If your going to use the MIM with the HPVFC, make sure you put a 1000uF electrolytic cap across the audio parallel to ground.

This was suggested by WB4APR when he discovered noise coming from the MIM's clock was getting into the audio. I will add a filter for the MIM/HPVFC combo board.

Hope you get this message, if not can someone forward it to Dave for me.

Thanks

I'd like to take the time to apologize to the SIG, and to Bill, for the last round of diatribes.

Bill, I'd suggest we need to take this off-line. Overall, I think we will need to agree to disagree.

The issue of railing about coordination has gone on too long. At some point,

I'll sit down and organize thoughts, and post those in as coherent a fashion
as I can concerning approaching a coordination group with an approach that
should be a reasonable response to most of the concerns likely to be adressed.

Again, there are several of us active in APRS who are also active within the
recognized coordination community. That we are APRS users has not enhanced
our standing too much, but at least we've been asked to explain what it does
and how it works. That's a first step toward getting enough understanding to
allow us to migrate toward a coordinted (in a different sense) effort for a
unified national frequency.

And as a final shot: From where I sit, I do not see a unified frequency
happening on 2 meters. It's too crowded, there are too many other uses for
145.79 besides APRS, that are already in place and more mature. Most
metropolitan areas have a backlog of analog requests for coordination, and a
surplus of digi's and nodes for packet using most/all of the recognized
channels. while that'd be nice, and I'd really like to see a 1200 baud, 2
meter channel happen, wishing won't make it so. If you can reasonably use
145.79 in your area, great. If you cannot, seek a homeland somewhere else and
let us know where it is. Me? I'm planning to migrate to 440. I suspect that
a channel in the 438.1--438.2 region might just be a possibility. Nationwide.
Still have to see concensus from the APRS user community to pursue that, and
then try to get concensus from the FC community to grant a channel or 2...
Anyone up for 9600 baud position reports?

73, gerry
n5jxs@tamu.edu

145.790 is the OFFICIAL APRS Frequency of Southern California! With the
addition of the Minimize option in the software, there should be no QRM to
the satelitte, shuttle or space station operations. What is distressing is
to see other communities buckling under to the squeaky few and NOT using
145.79! This is the NATIONAL frequency, not local! I am planning a trip to
Northern Cal for the Visalia DX Convention, but I might as well leave my
standalone tracker home! once we leave the LA Basin, APRS shifts over to
145.01 for some unknown and strange reason. 145.01 is supposed to be for
regular packet and keyboard/node/BBS operations. APRS on that freq is
ridiculous as it wastes that freq for normal users. That is why 145.79 is
there! So travelers can transverse the country with a single crystal rig
like my MFJ 8621 and be always on the map. Come on, Northern Cal! QSY to the
NATIONAL frequency 145.79 and give 145.01 back to the non-APRS Packeteers!
Is there QRM on 145.79? Yes there was QRM in SoCal as well, but with the
explosive growth of APRS, the interlopers realized their attempts to hold
the frequency were useless and they QSY'd! We are looking for more high
level WIDE nodes in LA area to give saturation coverage of all of SoCal.
So my question is "What is happenning in NoCAL?" Obviously APRS is active
in the Bay area but SY□Why on 145.01????

Please don't flame me because I'm new to APRS but I need some help.

Here is the problem:

A friend is preparing to fly from Hanscom Field (BED) to LAX in his Cherokee
then up the CA coast and back across the Rockies. I thought it would be great
to keep track of his progress (and safety) with APRS. His plane is equipped
with a panel mounted Apollo II GPS so I reasoned that we could just connect a
TNC and a handheld and be in business.

Could someone offer us some guidence? What gear is needed? Can I keep track
of his position all across the country? How difficult is it to interface the
radio/tnc/gps? Would a handheld GPS be better? How often should he transmit?
What frequency should he use?

Send replies to:

wannamaker@vpharm.com

Thanks,

~Woods

Hmmm. Interesting you should call the folks using the adjacent channel
"interlopers". I am sure that's exactly the same term (and I heard worse,
too) used about us APRS/packetters by the group that was there.
I've seen this mode of operation happen before, it's not pretty, and
it could backfire. Just plop down on whatever frequency you want and
gang up on your opponents. Cool. Did the 2Mtr SMA in LA finally really
approve 145.79 for APRS, or are you still referring to the San Diego
SMA group?

And yes, I do use 145.79 when I fire up APRS. So I guess I am
just as guilty (if guilt is necessary). I have also been at the
other end of this kind of skirmiish.

This is no flame, and Bill & Gerry should take their war to e-mail now.

667. Anyone interested in 220 MHz

From: n2czf@gate.net
Date: Fri, 22 Mar 1996 17:49:17 -0500
To: aprssig@tapr.org
Message-ID: <199603222249.RAA18274@osceola.gate.net>
Rendered body type: text/plain

I have been in a discussion PRIVATELY about this coordination with some other
people and two of us were thinking of alternatives. There is nothing sensitive
about the discussion but I do not see why we should add another 200 messages
about the same subject, let me just say "dead horse"...

We were wondering about the number of users that are active or at least able to
participate on 220 MHz if there was reason to do so. 220 is a GREAT band, I
operated it in the NYC area for years and like it better than 2M or 440 but in
many parts of FL all you will find are packet backbones. Right now the idea is
geared towards networking APRS so this is mostly directed to digi operators.

How many people would be willing to go the 220 MHz route for backbones on APRS
instead of 440 MHz ? Equipment is more expensive but the band is really nice.
Commercial grade equipment is also not existent so anything will need to be

```
amateur grade and probably PLL unless someone still has a stash of crystaled
Midland 220 MHz radios. Remember the days when 220 was almost given to CB, it
was so close that Midland made both crystaled and PLL equipment for the band
getting ready for the CB craze! Most ended up on the Sears Outlet Stores bargain
shelf, cheap but not cheap enough for a 10 year old. Remember that most
commercial sites will not ALLOW PLL equipment to be used so this is a
consideration to take into mind.

We can't give up on 440 without even starting but we cannot wait to try to get
220 MHz and possibly 1.2 GHz at a later date. Let's not argue anymore and just
DO IT!

145.79 is a very active LAN BBS frequency in the San Francisco area. When
APRS first started, I approached the Northern California Packet Assn (NCPA)
to coordinate a frequency for APRS. 145.01 was chosen by NCPA since it was
the old back-bone frequency and had the least utilization.

DR> ...known by some other means.  But notice that is the user's
DR> altitude above the center of the earth, and not above the local
DR> terrain, that is being used in this context.

The center of the earth is several thousand miles away. Must not be very
accurate for that purpose.

DR> The problem with using GPS or the differential version of it (DGPS)
DR> for the height dimension in a aircraft landing system is that the
DR> model for the earth's elevation immediately below the aircraft's
DR> descent path to the runway, and within its landing zone, must be
DR> quite accurate, as well as for below its go-around path in case the
DR> approach is aborted before touchdown.

DR> That's why most GPS and DGPS approaches in use, or being defined
DR> today for runways without an Instrument Landing System (ILS), use
DR> GPS or DGPS to create a horizontal reference to follow and then rely
DR> on, say, barometric altimetry referenced to local air pressure at
DR> the surface (i.e., the "altimeter setting") and the airport's
DR> published elevation to create the vertical reference above ground.

DR> Can't get to Cat III that way, but you can get an equivalent Cat I
DR> approach that way (minimum 600' ceiling and 1 mile forward
DR> visibility).

FAA had been testing the system for Cat III in California. Made over a
hundred landings. [April, Popular Science.] But there were two extra
transceivers on the ground. (In addition to the DGPS transmitter.) Probably
to augment position as well as altitude determination. That seems more
complicated than MLS. Why would they use GPS instead of MLS? (microwave
landing.) I would think the latter would be a lot more accurate.

What Model IIMorrow GPS is he using? It could be possible with the right
unit as you can get RS-232 serial data out. I will also need to check if
NMEA data is output. Let me know and I can check with our avionics shop
for the info. If the proper data out is available a Kantronics KPC-3
should be able to use it. I leave your choice of radio up to you as
mounting concerns for an external antenna in type certified aircraft has to
follow specific rules.

BTW don't worry about getting flamed. As long as you don't step between
two fighting elephants, you won't get squashed. Usually if you avoid the
hot topic of the week you avoid that.

If you are using "altitude" in the absolute sense as a substitute for one of the pseudo-ranges, then, yes, its accuracy is important. But its accuracy doesn't depend on how far away it is. It depends on

- how accurate is the benchmark that's providing your local vertical reference above MSL,

- on how accurate your barometric altimeter reading is relative to that local reference, and

- the value you use as the local earth's radius.

Percentagewise, the resulting error can be kept quite small, relative to size of the Earth's radius. Thats's certainly good enough to compute your horizontal position on a lat/lon frame of reference for most navigational purposes.

Height above the Earth's surface, or "relative altitude" is a different matter:

Landing an aircraft on the surface of the earth means, in part, to gradually close the gap between your aircraft's altimeter reading and airport's published elevation as you descend along your final approach course. The only factors affecting accuracy in measuring your height above the runway's surface are:

- the difference between the runway's actual high point and the surveyed elevation point published for the airport, and

- the accuracy of your altimeter, given that it has been adjusted so that, in effect, when your aircraft is sitting on that airport's surveyed elevation reference point, your altimeter reads out the airport's published elevation.

The latter is achieved in practice by adjusting your altimeter to the last locally reported "Altimeter Setting" before beginning your approach to landing.

****

>complicated than MLS. Why would they use GPS instead of MLS? (microwave
>landing.) I would think the latter would be a lot more accurate.

MLS is a very expensive system to install, both in the aircraft and at each airport where you would want it, relative to GPS-based landing techniques. In addition, MLS is not backward compatible with ILS and has no use on the aircraft other than for landing or taking off at MLS-equipped airports. While MLS will still be used in certain situations, it has lost most of its momentum as as the next international landing system standard, with the favorite contender now being DGPS-based systems.

In the meantime, ILS will continue to be widely used. The Instrument Landing System (ILS) has been improved considerably since the mid-70s when MLS threatened to replace it. It is not in danger of being displaced soon.

GPS is a much less expensive system to implement and use when viewed from the perspective of individual aircraft owners and individual airport owners.

That's because it is paid for by the federal goverment and its costs can be spread over so many actual and potential users, both civil and military.

Since GPS signals are broadcast globally, it works everywhere. Adding airborne-borne or ground-based users doesn't add to infrastructure cost, but thats does improve the benefits side of the equation and increases public support for its continuation at federal expense.

When aviation's uses of GPS's signals-in-space are considered, the things that add to implementation costs are primarily the requirements for:

- "Integrity"; i.e., the means to ensure that the signals being broadcast are good, and when they aren't, to warn off potential users in a timely way.

- "Differential Correction"; i.e., the means to broadcast corrections to users based on ground-based monitors of GPS signals operating at accurately-surveyed locations.

That's what the various GPS "augmentation systems" are all about, whether "local area" (low power, ground-based transmitters for broadcasting corrections) or "wide area" (transmitters on earth-satellites for broadcasting corrections).

FAA's wide area augmentation system (WAAS) is expected to be good enough to support instrument approaches down to Cat I ceiling and visibility minimums.

Local area augmentation systems (LAASs) are being developed get lower at selected airports, whether Cat II or Cat III minimums. These would be purchased for and installed at selected airports where the cost-benefits are seen to justify the costs, according to potential investors, whether public or private.

Band Planning has always been a regional process. You and I both know
that national plans fail to address the local issues. Here in California
the 440 repeater sub-band starts at 440, not at 442 as the ARRL national
plan indicates. Further more northern and southern California are
reversed from each other, input - output. When is southern California
going to get their 500, 440 repeaters to switch to the commercial standard
high in low out band plan?

How will the minimize command work with high level high power Wide digis and
the home stations that are grayed out? These stations are not running the
program and will continue to beacon.

Anyone looking to establish a 440 nation wide APRS frequency is out of luck
here in California. This is a vary full voice repeater sub-band. The
coordinated digital and packet operations are at 431 as well as 439 MHz.

> So my question is "What is happenning in NoCAL?" Obviously APRS is active
> in the Bay area but SY□Why on 145.01????

While some of us would like to operate on 145.79, the frequency has been
in use for several years as a full service networked bbs user frequency.
The choice of 145.01 was made after careful consideration of the
available key board to keyboard frequencies.. 145.01 had the least amount
of organized activity. It is now one of the busiest frequencies.

I personally do not buy the concept of nation-wide frequencies for a
particular packet mode of operation. Flexibility is the key. In a couple
years we will see the APRS protocol on several frequencies as more and
more packet applications integrate the system into their operations.

Once the Rose network puts the hooks for APRS into their system we will
be able to network several frequencies, region to region. The concept of
a single frequency based on the lowest common denominator cheapie radio
is absurd.

Someone might want to start a database of the different local and
regional APRS frequencies so they may be shown on the regional maps.

Just a question for all of you GPS hotshots..

Does anyone see a problem with setting up the reset.tnc file with all of the
commands for standalone operation..thus after signing off the laptop the

tnc-gps-transmitter will (with the flick of a switch for signal routing)
become a "stand-alone".

Also ,since I have no easy way of searching my archive of aprssig.mailings
what should the settings of the Garmin-45 be for APRS use?..(I've been
spoiled by my Magellan 5000)..

Thirdly..BAAMAP96.zip will be posted to the tapr filserver..in a couple days

Bob, (and anyone else who cares),

I have finally got a RS232 drop from my KLN90B aircraft GPS. I get a output
data stream every 5 seconds of about 10 lines of data. Bob, a while back
you told me that APRS works with this output stream. How? What do I need
to do to be able to broadcast this info from my aircraft in a useable
format? I would like to xmit data as I fly from Sioux City, IA to Dayton
for the Hamfest.

I have a data file I saved using QMODEM of a short flight around the airport
last week (about 5 minutes worth) if you need to see it.

Dave

I have done that... works nicely. I think I set up the Init file also, to
take the tnc out of GPS mode- but don't remember exactly how I did it.
My toggle switch is as shown in Bob's HSP schematic. When I used this mode,
my switch just jumpered
the RX data from the GPS to the TNC's TX data input. I was going to replace
it with a relay that was released when the pc was disconnected from the
cable so it would be automatic, but never got a "round tuit".

Just make sure the Garmin-45 I/O Setup is configured for:
NMEA/NMEA
NMEA 0183 2.0
4800 baud

That's it. Every couple of seconds, all applicable sentances are sent
out.

I am trying to figure out the GPS 45. This is all new to me and at this
point, I am totally lost.

I have a AEA PK-12 with the AEA APRS adapter cable.
I have the Garmin Data/Power cable.
The Garmin white wire is connected to the tip wire on the AEA Cable.
The Garmin brown wire is connected to the ring sleeve wire on the AEA Cable.

```
Tbaud is 4800
GNMEA1 is $GPGLL
GNMEA2 is $GPVTG
GPSA IS ON
GPSM IS 1
```

GPS45 I/O Settings are
NMEA/NMEA
NMEA 0183 2.0
4800 baud

There does not appear to be any data comming from the GPS Receiver.

Does anyone have any ideas or suggestions?

Don't know about the AEA settings... Anyway, the GPS mode settings in your
TNC aren't needed when you use APRS on the computer that is connected to the

TNC and GPS (which I assume you are using, since you are using the adapter
cable)

>GPS45 I/O Settings are
>NMEA/NMEA
>NMEA 0183 2.0
>4800 baud
>There does not appear to be any data comming from the GPS Receiver.
>Does anyone have any ideas or suggestions?

Yes:

If you are only connecting the GPS/TNC to make a tracker, then lose the AEA
adapter cable.
In either case, you also have the Garmin connected wrong
On the Garmin cable:
Brn=output data   Connect to tip on the AEA cable   OR in stand alone
mode, connect it to the RS232 input of the TNC
blk=ground   Connect to ring on AEA cable.   OR in stand
alone mode, connect it to the RS232 output of the TNC
white= data in to Garmin (only used with certain applications)
red= 5-40 v DC power input to GPS 45

Hope this helps

Yes, I use it on the KPC3.
The critical thing is supplying it power, just like the Paccomm switch, it
expects power on a certain pin (from the TNC)
I wired the KPC3 for external power IN on the rs232 plug (pin 25), then
powered it from the small coax power jack and stole power FROM pin 25. One
jumper change in the AEA switch, and it got power from the proper KPC3 pin.

688. New wx monitor ? ?

From: KD4EMI@aol.com
Date: Sun, 24 Mar 1996 11:52:23 -0500
To: aprssig@tapr.org
Message-ID: <960324115223_453588610@emout06.mail.aol.com>
Rendered body type: text/plain

I was helping a friend with his gps, and we went to West Marine
supply store. I noticed the Davis wx monitor and also the WEST MARINE
wx monitor.   The vane and box looked exactly like the Peet 2000.

I casually asked how much it was and the guy said about $175.00

I thought it was a mistake, after all, the peet and davis machines
are about $350+ bucks.   Sure enough there it was, $175 bucks.

IT looks JUST LIKE the peet unit but doesnt come with a computer
interface.   ANY ideas brewing guys...?
So before I buy this thing, any suggestions, I would think it shouldnot
be that hard to interface to a computer...right ? wrong..?

I suppose I should go and buy it and try to play with the thing.
But, I wanted to let everyone know about this device to foster
comment.

689. Filters ?

From: mark.endicott@nashville.com
Date: Sun, 24 Mar 96 08:22:13
To: aprssig@tapr.org
Message-ID: <199603241942.NAA12589@tapr.org>
Rendered body type: text/plain

Bob and Other Sig Members;

Will someone please explain what the "Filter" does when
using APRS (Both 74e and 75). The following occurs with one
particular digi.

Mode 1:

With the Filter set to "BCNS" I DO NOT see the following
digi on my screen, or see it in the Digi or Heard List.

```
KC4WPS-3*>WA4GKM-5>N4NEQ-3>N4NEQ-2>WIDE:!3625.54N/08629.30W#
PGH3663/WIDE-RELAY...KC4WPS-3
```

Mode 2:

With the Filter set to "othr" I see the above string as a
GREEN STAR, as I think it should be, and SHOWS up in the
Digi and Heard list. However the other digi's in the area
fade away.

It appears obvious that there is something wrong with the
above beacon string, but what ?

While on this subject what does the "JUNK" filter do? I
have looked at the DOCS but still don't know what it's
doing.

```
    If Found, Please Return To:

690. Garmin 45 track log -> APRS HST

From: Mike Tyrrell <100321.1327@compuserve.com>
Date: 24 Mar 96 16:19:47 EST
To: "'APRSSIG'" <aprssig@tapr.org>
Message-ID: <960324211946_100321.1327_JHF70-1@CompuServe.COM>
Rendered body type: text/plain

Does anybody have a program which will convert a track log from a Garmin 45 to
APRS HST format?

The track log lines looks like this after uploading to the PC but I need it in

HST format to be able to read into MAPFIX.

053 15.545'N 002 30.985'W 96-03-23 13:16

Thanks,
Mike   G6GAK

691. Brand new to this branch of the hobbie.

From: BWYATT@MESNET.MESONET.UOKNOR.EDU
Date: Sun, 24 Mar 1996 22:04:00 +0000 (GMT)
To: aprssig@tapr.org
Message-ID: <01I2QD5M0N6QAM5DCC@MESNET.MESONET.UOKNOR.EDU>
Rendered body type: text/plain

I have just begun to delve into the APRS part of packet. I have seen it work from a distance and it is very inviting.

Let me give a little back ground which may be helpful in responding to my request for information. I have a good working knowledge of packet radio and a far relationship with GPS. I also have a good working relationship with PC computers.

Now down to the meat and taters of this message. I see there are several version of APRS soft-ware around and my question is where to start and what files, directories and the likes do I need. I run WIN95 and would like to take advantage of its features if there is APRS soft-ware out there for WIN95.

Thanks,

Bill Wyatt KD5JR

Jim,

Do you have a copy of the data specs on this unit? Here is some sample data flying the patch (SUX) in my aircraft. At $200/he I didn' stay up too long. Let me know what you figure out--Dave

I have seen the the WX unit at West Marine for over a year now and I have wondered the same thing. With a small company like that I am sure they have no problems making a special version that has no interface at alll but also I am sure they are not going to make a whole new batch of PC boards without the port adapter.

It is a interesting thought but the West Marine model has been out for longer than the 2000, I wonder how similiar they are ?

In fact, the idea is that most/all aircraft will eventually have GPS, while
most of teh MLS systems would have been installed on on commercial jets.

the Pseudollites are not "too" expensive, especially compared to MLS systems,
and once their position has been surveyd in in 3 dimensions and corrected to
the WGS84 geoid, the altitude corrections are pretty darn good.

Please recall that altitudes are referenced to a 3D mathematical model of the
earth, which is not a perfect match, but if you re-reference everything into
the same system, things begin to look better.

I really do think this is a key point!  Frequency agility over time will do
more for APRS and nationwide tracking than fighting among ourselves, or with
other members of the ham community, for "A" channel.

> Once the Rose network puts the hooks for APRS into their system we will
> be able to network several frequencies, region to region. The concept of
> a single frequency based on the lowest common denominator cheapie radio

I began to read the wx stuff on the included aprs program.
It slays me to pay $350 bucks for that wx monitor.

Mentioned in the wx txt file, it says that Davis wont release the data
string because it's proprietary...etc

Am I on the wrong track here ? Couldn't we hook one up to
a terminal emulator at the correct speed and just read the data ?

Then Bob could write the software?
IF so, Id be willing to spend $175 bucks on one to help.

Sometime ago, Dick Rucker wrote:

DR> - the accuracy of your altimeter, given that it has been adjusted so
DR> that, in effect, when your aircraft is sitting on that airport's
DR> surveyed elevation reference point, your altimeter reads out the
DR> airport's published elevation.

Accuracy of altimeter is only plus or minus 100 feet. Is that good enough for the purpose? What are the requirements for "non-precision" landing?

DR> approach to landing. In the meantime, ILS will continue to be widely
DR> used. The Instrument Landing System (ILS) has been improved
DR> considerably since the mid-70s when MLS threatened to replace it.
DR> It is not in danger of being displaced soon.

The problem with ILS is that it is a pencil beam straight line, that doesn't lend well for the purpose of noise abatement, which is a growing problem in small towns as well as major cities. Is the Glideslope portion of the ILS more precise than the altitude determination with DGPS? If so, can the DGPS be further developed in the future to augment vertical reference, equal to the precision of the ILS glideslope?

DR> Since GPS signals are broadcast globally, it works everywhere.
DR> Adding airborne-borne or ground-based users doesn't add to
DR> infrastructure cost, but that does improve the benefits side of the
DR> equation and increases public support for its continuation at
DR> federal expense.

I've heard that the Europeans are reluctant in accepting GPS because it is controlled solely by the DoD (U.S. Defense department or Pentagon.) It can be turned off at will. i.e., at the Pentagon's will. How valid is this argument?

DR> When aviation's uses of GPS's signals-in-space are considered, the
DR> things that add to implementation costs are primarily the
DR> requirements for:
DR>
DR> - "Integrity"; i.e., the means to ensure that the signals being
DR> broadcast are good, and when they aren't, to warn off potential
DR> users in a timely way.
DR>
DR> - "Differential Correction"; i.e., the means to broadcast
DR> corrections to users based on ground-based monitors of GPS signals
DR> operating at accurately-surveyed locations.
DR>
DR> That's what the various GPS "augmentation systems" are all about,
DR> whether "local area" (low power, ground-based transmitters for
DR> broadcasting corrections) or "wide area" (transmitters on
DR> earth-satellites for broadcasting corrections).
DR>
DR> FAA's wide area augmentation system (WAAS) is expected to be good
DR> enough to support instrument approaches down to Cat I ceiling and
DR> visibility minimums.

DR> Local area augmentation systems (LAASs) are being developed get
DR> lower at selected airports, whether Cat II or Cat III minimums.
DR> These would be purchased for and installed at selected airports
DR> where the cost-benefits are seen to justify the costs, according to
DR> potential investors, whether public or private.

What is Cat I minimums? About 600 feet? Who financed WAAS? How many WAAS satellites are required to cover all of contiguous United States? Are these satellites geosynchronous? I understand the GPS space vehicles used to be geosynchronous. When did they change to non-synch?

The Norwegians are using their FM broadcasting band (the band we use for stereo music) for the Differential part of the D-GPS. Why can't we do the same and save a lot of money, since FM signal is ubiquitous all over the States. Just let FCC allocate a small portion of the FM band (low or high end) for D-GPS. Either that or let the differential signal piggy back on existing commercial FM broadcasting stations. Wouldn't that serve the purpose of the WAAS or LAAS, since every city and small town with an airport also has FM stations playing stereo music? If it's good enough for fishermen, it should be good enough for pilots. Furthermore, it would work well around automobiles, motorhomes, and yachts close to land.

Rendered body type: text/plain

The Northern Illinois APRS Net (NIAN) would like to thank the following
amateurs for participating in our net conducted on 3/24/96 at 2100 UTC.

KB9LBU	Roger, GPS mobile
N9VHW	Jerry,Streamwood IL
N9WMM-1	Henry, Midlothian IL
KF0QN	Bill,Aurora CO
NY2U	Bill, Troy NY
W6OAV	Bill,Englewood CO
N9LJY	Tom,Lemont IL
N9VDP	Rob,Carol Stream IL
N9NWA	Randy,Downers Grove IL
W1GTT	Bill,East Lyme CT
NO1R	Steve,Chelmsford MA
KB0MQQ	Lloyd,Lakewood CO
N9LCI	Ed,Aurora IL
KB9KOZ	Jim, Cary IL

and a mobile in Shakopee,MN that I forgot to write down

This was NIANs first attempt at a nationwide net. It appears that almost all
of the stations shown on my map checked in. We would also like to make this
net a weekly feature.
Since this was the first time, there was not much traffic to pass. I'm sure
that will change in the future.
A question was raised as to why I was using BLN to communicate. By having net
control send a BLN, all stations can see it at the same time, and no acks are
required.
Again, we need to work some bugs out, but, it seemed to go very smoothly.
Any comments or questions would be much appreciated.
Please direct all email reference the net to me-- WB9WOZ@aol.com
While you are online, check out the NIAN web page at
http://tbcnet.com/~davidc/aprs.html

Thanks & 73s
Bruce Tobias

Regretfully Mike, you are forgetting the most important part...the analog
to digital converter, aka modulator/demodulator, aka modem....the wx
boxes are analog devices...they must have hardware designed to talk to a
computer....In the case of the Davis,,the A/D converter is in the cable
to the computer...part of the reason they won't give up the info....

To: aprssig <aprssig@tapr.org>
Message-ID: <3156AD38.6B6E@mo.net>
Rendered body type: text/plain

Hi, I am new to APRS and I am trying to interface my Mac Plus to a
AEA PK-88 using MacAprs. I talked to Keith (WU2Z) on the phone last
night and the program MacAprs seems to be running ok but the tnc
won't talk to the Mac or visa versa. I was wondering if there is
anyone out there using a Mac Plus and possibly a PK-88 who could
shed some light on my problem.

Using my communications program (Termworks) I can monitor the aprs
activity on 145.79 so I know that my cable between the Mac and the
TNC are hooked up ok for normal packett operation. However when I
load and run the MacAprs program the data received by the tnc
doesn't get to the MacAprs program.

Thanks in advance, Tom W0MTQ

>Accuracy of altimeter is only plus or minus 100 feet. Is that good enough
>for the purpose? What are the requirements for "non-precision" landing?

Good enough to get you below the cloud layer so you can visually acquire
the runway and use visual means to get yourself down on it. That's what
the published forward visibility and cloud height mimimums for such
approaches are all about.

>The problem with ILS is that it is a pencil beam straight line, that doesn't
>lend well for the purpose of noise abatement, which is a growing problem in
>small towns as well as major cities.

When folks can afford to do better, they will. MLS was not a good solution
in that regard. In the meantime, ILS is about all we've got to offer where
precision glide-slope guidance is needed.

The main interest in DGPS-based approaches is for runway ends that aren't
now served by an ILS. If descent guidance of some sort is needed in

addition to horizontal guidance, the question is how to get that.

Basically, there are two choices: barometric altimetry and use of GPS-determined height above runway. To make the latter work, you need to re-survey the runway in GPS coordinates. Both solutions are being worked; it's not an either/or matter.

>I've heard that the Europeans are reluctant in accepting GPS because it is
>controlled solely by the DoD (U.S. Defense department or Pentagon.) It can
>be turned off at will. i.e., at the Pentagon's will. How valid is this
>argument?

It depends on your point-of-view.

If you choose to worry about things like that, then your choice is to continue to depend on traditional landing methods, and many still do that.

If you can make a buck by depending on the existing GPS signals-in-space, and that's what motivates you, you can plan on investing in GPS or DGPS based avionics and hope that FAA's WAAS or the local airport's LAAS will let you know in a timely manner whether you can safely continue your approach using GPS signals-in-space right now or not.

If you like the Russian GLONASS system better than GPS, you can invest in a GLONASS compatible navigation/landing system instead. Getting FAA certification to operate such a nav/landing system in this country might be another kind of a problem.

If you're wealthy enough, you can buy one of each: a GPS receiver and a GLONASS receiver and feed both signals to your on-board navigation system and pick which one you want to trust. Some airlines have been investigating joint use of GPS and GLONASS.

>What is Cat I minimums?

According to ICAO, the vertical minimums for ILS are:

	Decision Height (DH)	3D accuracy req'd (2 sigma)
Cat I	200 ft above surface	56' horiz, 13' vertical
Cat II	100 ft above surface	17' horiz, 6' vertical
Cat III	50 ft above surface	13' horiz, 2' vertical

DH is the indicated height above the surface at which the pilot must visually acquire the runway without question or abort the approach and try again or try somewhere else.

Forward visibility minimums are another factor, but we're discussing the vertical element.

>Who financed WAAS?

US taxpayers; it's an FAA program.

>How many WAAS?

I don't remember or have quick access to the details of the program. At one time, INMARSAT was offering CONUS coverage from some of their communication satellites, but I don't recall whether the FAA took them up on that or not. In any event, these are data comm satellites that are completely independent of the GPS navigation satellite constellation. Whether they will be geosync or not is basically an economic, not a performance, issue.

>The Norwegians are using their FM broadcasting band (the band we use for
>stereo music) for the Differential part of the D-GPS. Why can't we do the
>same and save a lot of money ... If it's good enough for
>fishermen, it should be good enough for pilots.

The point is to save lives first, then money. Further, the potential users of WAAS require continuous down-to-the-surface coverage of all of CONUS. That's an objective which can't be satisfied by ground-based broadcasters of any stripe.

If you studied the stringent performance and availability requirements placed on both FAA's WAAS and any FAA-certifiable LAAS, you'd see that what is good enough for FM stations, auto drivers, and fisherman isn't considered nearly good enough for instrument landing systems used to support public air transportation.

I use the GARDOWN7 program to capture the track log from the Garmin 45 which produces a listing like you showed. That file is then run through a program (if I remember the title correctly) GAR2HST which will convert the GARDOWN7 file into and APRS HST file. I'll take a look for it and pass it on to you as soon as I can this evening.

Actually I bought the West Marine weather station when there was only the U-II. It was the same price and gave me a better return policy. I have spoken to Peet Bros. about the U-II vs. West Marine and they say that they did NOT make any mods for resellers. BUT, if I recall, they also said they are making mods to resellers for the U-2000. I would call Peet direct, they were pretty open for me.

For details on in-expensive A->D systems you can hang off a centronics
printer port, check out URL:

http://www.ee.ualberta.ca/~charro/cookbook/comp/parallel/

Specifically, you will find the following useful projects:

4chan8bitadc.asc
       4 Channel 8 Bit Analogue-Digital Converter, using the parallel port
8chan12bitadc.asc
       8 Channel 12 bit analogue-digital converter using a parallel port
adc11.tar.Z
       11 Channel 10 bit analogue-digital converter using a parallel port
dac.asc
       Very simple Digital to Analogue converter using the parallel port

Bill (and others):

If you know what towns I65 is going through, you could probably
download the CIA US Cities Lat/Lon database.  I've used this to
help center quite a few APRS maps on towns I couldn't figure the
lat lon from a paper map.  It's about 7.2 Mb expanded, but is
pretty thorough...

Quite simply, yes. Once you enter a valid registration number, your
config info will be saved automatically.

Well Jan that won't work to well with these maps. Your right on the towns
and city's, i use that file also for normal city maps, but that wouldn't
work for the simple reason what would i do in between the small towns.
Well i did figure out a way and now have 34 maps made and am down to
Mongomery Alabama, so don't have to awfull far to go to the coast Hi.
Thank for the help Jan.

715. FT-2400 Problem

From: "Brad Thomas" <bgt@thomascomm.com>
Date: Mon, 25 Mar 1996 10:34:54 +0000
To: aprssig@tapr.org
Message-ID: <9603251835.AA01889@server1.deltanet.com>
Rendered body type: text/plain

```
Hi everyone,

Just finished this last weekend building a standalone tracker and I
have one bug with it that I was wandering if any of you have the
answer to.

I'm using a Garmin 45 wired to a KPC 3 (w/ vr. 6.0 ROM). I have the
TNC wired to a Yaesu FT-2400 2 mtr. radio thru the RJ45 mic jack.

The package works great in sending out positions except on power up
when the GPS is acquiring satalite data the 2 mtr. radio will
occasionaly go into scan. The "lock" feature on the radio does not
correct this problem.

Any ideas?

Thanks in advance.

Brad

For the first time since i have been running APRS and GPS trackers i am
now ready to add a laptop but i.m having problem. When i run the whole
thing i do get the first position on my map, but that's all. I did notice
that on the upper right window it says [HSP] Time out. Is this my
problem. I'm using a Paccomm Handy packet and the Paccomm cable, of
course you would think this cable would fit a Paccomm TNC but is has the
wrong gender connector, but that's not the problem Hi. By the way the
setup works great as a standalone tracker!.

>
>Kevin
>KD4UYR
>
>
Sorry Kevin, the a/d is the EASY PART...any $40 chip / small board can
do that.   Its not a ANALOG DEVICE besides, it has a small lcd screen
just like the other wx monitors.   I have not heard from anyone about this
particular item so I have to go in reverse.  Can someone tell me what the
Peet Bros output is like ?  Then I can at least know what to look for
in this unit and what to do to convert.  That lttle box that peet sells is a
simple A/D converter.

A/D conversion is now quite easy with not only basic stamps but other
small chips and is inexpensive.

Here's a suggestion for the California folks...

Why not do a "hidden" UHF point-to-point link between your two closest
digipeaters?  By using a dual-port TNC (such as a KPC-4) and setting BOTH the
digi alias AND the gateway alias to WIDE (or whatever you guys can agree on...)
will automatically send the received packet through the gateway while also
digipeating locally!  Now, what about that UHF frequency that APR-Bob proposes
in the README files?  It's already approved in Kansas....

Best 73,
Jim Duncan, KU0G

If you have a REMOTE CONTROL capability on that try disabling it during GPS
"missions". Remote meaning that a DTMF tone on RX will cause the radio to do
different things. I know that this may be a long shot but my Kenwood 742a is
well known for doing strange things like changing my offest or frequency if it
hears a DTMF tone or someones voice just hits the right frequency range. Your
packet audio may be playing a nasty trick on you as some peoples voices do to
me!

Subject: [APRSSIG:7866] FT-2400 Problem
The package works great in sending out positions except on power up
when the GPS is acquiring satalite data the 2 mtr. radio will
occasionaly go into scan. The "lock" feature on the radio does not
correct this problem.
Any ideas?
Thanks in advance.

Rendered body type: text/plain

Hi all ..

Thought I'd toss one of my current 'problems' into the pot and see if any advice is forthcoming!

A NEC VERSA 2000D joined my toybox recently .. and I've had a lot of fun putting it to use here in the shack and elsewhere. The only application that I've had REAL difficulty with is getting the laptop to communicate with the TNC (TAPR TNC-2) and the APRS7.5 programme. The laptop has only one serial port - and as far as I know it is COM1. It works fine with my USR 28.8 modem, my simple SSTV interface, and with the TNC-2 for regular PACKET operation, using the PAKET 6.1 terminal prg.

BUT when I call up APRS .. the initial title screen appears .. and the prg moves to the opening map (ONT17 I believe) and at first attempts to talk to the TNC the prg freezes or locks up. Yes, I have gone through config again, entering COM1 etc. .....

In spite of this .. I have been able to get into the APRS prg in a roundabout way. I turn on the laptop and let it go into WINDOWS 3.11 .. I then select a 'modem check' prg that is part of the FAX prg group .. run it ... that little prg does its thing .. and then announces that I have NO modem attached. I exit that modem check prgramme .. exit WINDOWS to Dos 6.22 .. cd to APRS dir .. load the APRS .exe file ... A N D ...

.. THEN the APRS7.5 starts as before but does NOT stall ... runs fine. I can exit APRS .. go to paket ... use other prgs on the laptop .. return to and load up APRS again .. and prg still runs as it should. BUT if I turn off the laptop .. I'm back to a 'no go' situation next time I return .. unless I repeat that same roundabout routine.

Any ideas that might help me out?

73, John.

I'm ready to try almost any of the bands. I have a 220 mobile rig and an HT. Also have a 440 mobile rig and HT that will work 440-450, and one newer HT that will work 438-450. Nothing at 1.2 Ghz yet.

FYI.

729. Satellite Experimenets...

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 25 Mar 1996 21:49:38 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960325213146.9218D-100000@greatlakes>
Rendered body type: text/plain

Experimentation proceeds slowly on the WO-18 on which we have full permission to send all the UI frames we want... But WO-18 needs pacsat modems.... In the mean time... I mentioned another satlite....

It is AO-27! A flying 2m FM uplink and 70CM FM downlink FM! Its just a normal ole voice repeater for FM! Now, I do NOT want to encourage sending PACKETS until and unless we get an official blessing, BUT THERE IS NO REASON WHY EVERY MEMBER OF THIS SIG should not be encouraged TO PLAY VOICE ON THIE SATELITE! TOday I heard a guy running 5 watts!

We need to build up a cadre of operators experienced with this spacecraft and get profficient at it before we ask for permission to send out packets... The satellite controlers have no objection to some packet experiments, but the usual voice users might... so IF "WE" BECOME the "USUAL" operators.......... You get the picture.... hi hi

Here are the details:

```
SATELLITE:  AO-27
NOMINAL MODES:  FM voice
UPLINK:         145.85 MHz FM
DOWNLINK:       436.80 MHz FM (starts at 436.805 and ends at 436.790)
ACCESS:         3 passes daily between about 9AM and 1PM... LOCAL TIME
```

OPERATIONS: It's only on during DAYLIGHT passes due to power limitations. You can hear it on an OMNI antenna. A transceiver in your car with 10 feet of coax will hear better than a tower mounted antenna but with 100 feet of coax (unless you have a preamp). Forget trying to work it on weekends, but during the week, I hear lots of dead time...

Currently it has a timing problem, and shuts itself off a little early but it is on from initial horizon to most of the next horizon.

I will try to listen to all daytime passes. Remember it is a SINGLE voice channel like an FM repeater that only is usable for about 5 minutes! So anything more than Hi...Bye is about it... But so we know who we all are I suggest something like CQ APRS..... Or "This is W3ADO APRS station....."

See ya on 436.805 at start of doppler and down to 436.790 by the end of the pass....!

>
> What do we have to do to get these guys on??

WB4APR REPLY COMMENT: Well, here is why you didnt hear me... I been

running 20 second beacons from my car for a week! BUT SUnday night my
wife answered the doorbell to find a bunch of scruffy "HAMS" on the front
porch with lots of antennas.... Seems when I was out using the car on
Saturday I used the 2m mobile to listen to the local REPEATER for a while....

Yep, left it on that freq then for the next day and a half with 20 second
beacons... WHICH NO ONE COULD DECODE because they were manchester encoded
packets for WO-18!

Well, at least I got to congratulate them on a DF hunt well done, and
invited them in for an APRS DF DEMO! hi hi

> you told me that APRS works with this output stream. How? What do I need
> to do to be able to broadcast this info from my aircraft in a useable
> format? I would like to xmit data as I fly from Sioux City, IA to Dayton

WB4APR REPLY COMMENT: I hope it still works in APRS, Here's what I know:
1) I call that the ARNAV format. It is usually a lot longer than 10 lines
2) It starts with a CTRL-B and ends with a CNTRL-C (or something like that
3) If you have an APRS laptop, AND have the APRS ARNAV registration, then
   APRS should be able to plot your posit and do the normal beaconing...
4) Im not sure if any of the TNC's will do the nomral stand-alone-tracker
   parsing of this data. PacComm says their commercial TNC's will...
   But still its a LOT of data transmitted for just a simple LAT/LONG is
   all you need....
5) Only one person to date bought the ARNAV registration over a year ago,
and I never got any feedback if it worked for him... Since I dont have
an aircraft, I cant test it live....

> How will the minimize command work with high level high power Wide digis and
> the home stations that are grayed out? These stations are not running the
> program and will continue to beacon.

APR REPLY: FOr now, it wont, but those stations only beacon ONCE every
15 to 20 minutes, and that should not be a big problem, HOWEVER, I am
hoping that some of the leading TNC MFRS will include the minimize in
their TNC digipeaters eventually...

> Someone might want to start a database of the different local and
> regional APRS frequencies so they may be shown on the regional maps.

WB4APR REPLY COMMENT: IT EXISTS!!!! Just load or replay the FREQ-USA.bk
file or is it USA-FREQ? or something like that. It will show all of the
APRS frequenceis that I know of.

NOTE TO ALL!!! If you are operating a net, be sure it is shown in this
file. ALso be sure all of your permanent digipeaters are in either the
DIGIWEST.bk or DIGIEAST.BK file... THanks

> We were wondering about the number of users that are active or at least
> able to participate on 220 MHz if there was reason to do so. 220 is a
> GREAT band..... Why not APRS...

WB4APR REPLY COMMENT: In my humble opinion, 220 radios are too hard to
find. THe BEST UNUSED Band in MY OPINION is 6 meters! You can find TONS
of surplus single freq radios even at the 100 wattt level for about $20
to $50 a piece at ANY hamfest. AND everyone knows that mobile coverage
on 6 meters is FARTHER than 2m or 220 or 440.

The only shortcoming used to be TVI, but for MOBILE work, there is NO ONE
TO QRM! ALso for backbone work, there is NO ONE TO QRM on the mountains
tops. DO NOT work 6m APRS from your HOME, but it appears to me to have
EVERYTHING else going for it. The one thing it DOESNT have is off the
shelf HAM radios. but at $50 a piece, look in any radio wantadds and you
will see LOTS of LOWBAND radios for sale (as the public service angecies
move to 800 trunked radio...)

WB4APR REPLY COMMENT: Watch those connectors on the HSP cable, the SEXES
of the cable can be misleading. You cannot take the cables you use for a
stand-alone-tracker and just plug them into an HSPO switch, because pins
2 and 3 will be reversed. NOtice that in TRACKER mode, the TNC is
talking to the **TNC** but in HSP the GPS is talking to the **PC** via
the HSP siwthch. So for that application you must reverse pins 2 and 3
in your GPS cable (something like that anyway...)

Message-ID: <3157FD0B.6486@mo.net>
Rendered body type: text/plain

I want to thank everyone who answered my plea for help in getting
MacAprs to work with my MacPlus and PK-88. The good news is that I
found the problem and it seems to be working fine. (The hardware
handshaking wasn't hooked up properly)

Since I am real new at APRS I will now have to learn all of the "ins
and outs" of what it is all about.

I have a Garmin 45 and hopefully I will be able to put a tracker on
the air as soon as I get a GPS compatable TNC.

Thanks again for the help and I will continue to monitor the sig for
interesting info re APRS

Tom

>
> Bill KE4EER

Bill,

You need to add a 1k resistor from pin 6 of the HandiPacket RS-232
connector to +5VDC.

If you provide me a fax number I'll send you a copy of the suggested

installation and several other handi pages about the APRS port switch.
(Or postal address).

Regarding the gender of the cable connectors on the APRS port switch. I consider it an accessory for the APRS computer. It allows making the computer appear to have two serial ports instead of one. In that vein, the connectors on the 'non-computer' end of the cables are the same as the serial port on the PC. The thought is that you take the GPS to computer cable you already had (but had no serial port to plug it into) and plug it into the port adapter. Same for the TNC cable.

73,
Gwyn

```
Bob B.
        The Torch is coming right thru my QTH of Cedar Rapids,IA I have dos,
win street level map's if anyone is interested. Also is there anything going
on as far as APRS and the torch run? I know Coke has the sponsorship, and
there's been some messages to hold off on any APRS activity in that area. So
I've kind of bypassed the torch messages for awhile. So I'm here APRS is
running in several sites in the area. we're linked to the quad cities.......
I guess I'm just stating that there are assets in place at one of the torch
stop's that would be available for anyone to utilize, if there is a request.
We've several GPS stand alone trackers 1 WX site an APRS digi link to an HF
Gate in the Quad Cities.
        There's K0BGP(Wide),NM0B(2 GPS, 1 WX),KF0Z(RELAY
to),W0BXR(WIDE),WB0BBM(WX,HF GATE)

>
> With the Filter set to "othr" I see the above POSIT OK..

WB4APR REPLY COMMENT: Filter to BEACON filters all packets not addressed to one of the typical UI addresses of APRS, BEACON, CQ, QST, etc. The DIGI-master in the above case has the TO address = WIDE instead of the normal APRS.... ERGO, it is filtereed out. When you set APRS FILTERS to OTHER, then all packets are accepted and you see it. Pse tell the DIGImaster to change his UNPROTO to APRS VIA xxxx,xxxx,etc...

>to $50 a piece at ANY hamfest. AND everyone knows that mobile coverage
>on 6 meters is FARTHER than 2m or 220 or 440.

Oh, boy, Bob. I don't mean to pick on you, but I have to differ with almost everything you've asserted here. (Oops.)

<<220 radios are too hard to find>>

Maybe on the used market, but not new. Granted, they're invariably 2 to 3 generations behind the "current" stuff in 2m or 70cm, but all of the majors have *something* for 220. Conversely, try finding a new FM mobile for 6m - there are exactly two, and both from (IMO) non-preferred manufacturers. And a 6m HT, for a tracker? Only one, and again not one that I'd be comfortable having.

<<BEST UNUSED Band ... is 6 meters>>

Ooo. If you think that you're catching flack for trying to get consensus for "national" frequencies in 2m and 70cm, heaven help you in 6m. There are no fewer than *five* opposing repeater split plans, and lots of overlapping and conflicting local plans, with some groups already girded for defending their turf. In your favor, however, is the "non-voice" area from 50.60 to 50.80, which, after checking the database, seems to be respected in actual use. Also, because of the relative lack of activity in your area don't diminish its popularity in other regions.

<<TONS of surplus single freq radios... ANY hamfest>>

Hmm. I presume you're talking about old Low-VHF mobile rigs. I've found it to be a very spotty market these days, and depends entirely on what area agencies have or haven't upgraded. In our area (the Midwest), low-band rigs are very hard to find; we just put-up a 6m repeater, and found this out the hard way. What is available are usually MASTR PRO's, MICOR's, or MOTRAC's - all boat anchors which will run you another $50-70 to recrystal - and I've seen a goodly amount of pure junk. My first-hand experience is that these things aren't usually worth the time it takes to get 'em running, an effort, frankly, well beyond the technical scope of a lot of hams.

Besides, could you imagine building a tracker out of one of these 40-pound monsters? Not me! ;-)

<<everyone knows that mobile coverage on 6 meters is
FARTHER than 2m or 220 or 440>>

When "the band is up", it's great stuff, and out in the boondocks it's o.k., but around town 6m is QRM'ed by everybody and everything. Groundwave is horrible in settled areas, and you are unlikely to get enough quieting to make packet usable. I dislike using 6m for around-town utility because it is so noisy. I still do it, albeit primarily to humor the others who are just getting their feet wet in the band.

==========

I'll agree with the others that 220 is a good candidate. The main problem is lack of uncontended space. The expansion of the "recognized" (I use that term lightly) packet area to the space from 223.52-223.64 is in our favor, but how heavily that spectrum has been usurped for inter-node links is going to be subject to regional and personal system preferences. In some areas (the Northeast in particular), I think that area is already heavily developed. Finding a common frequency without significant conflict will be a tough row to hoe.

1.2GHz has been suggested by a few here. I have a repeater and a fair amount of equipment for 23cm, so have lots of hands-on experience with the band. It's a fun band to play with and, for APRS, the likelyhood of getting frequency consensus is the best of 'em all.

I'd personally *love* to see APRS on 23cm, and I may even put together a net of APRS-based automatic DF sites on 23cm. But for general use, mobiles will "blind spot" pretty badly, equipment is all but unavailable (the importers have essentially abandoned the band in the U.S., even though it's popular in Japan), and what *is* available is expensive. When I see 8-year-old HT's command $275 at hamfests, you know that they're tough to get.

Again, my intent was not to bubble-burst, Bob, but more to relate that my experiences run counter to what you were suggesting.

FOR THE TORCH RUN, I am building a TORCH.HST file that shows every CITY that has DIGI coverage, and those that dont based on all the DIGIS listed in DIGIwest.bk and DIGIeast.bk. The file will should also include all GATES. Everyone that wants to help out, needs to do the following:

1) FILES-LOAD the DIGIeast or west.bk file for your area... IF YOUR PERMANENT DIGIS are not in that file, send me their P-LIST entry ASAP.

2) Do a MAPS-PLOTS-POWER so you see the radio range of the digis. DONT TRUST these circles, apparently most DIGImasters don't understand HAAT.

3) Replay the TORCHx.bk file for your area and note whether or not there is good DIGI coverage.

ACTION REQUIRED:

(A) If your DIGI was not shown, SEND IT IN
(B) If your DIGI was NOT shown and it covers a city on the torch run
     SEND IN THE CITY NAME
(C) SEND ME the PLIST entries for ALL KNOWN PERMANENT GATES. I will build
     a GATES.BK file...
(D) IF you can GUARANTEE a temporary DIGI for the day for your city, then
     send in that CITY with the notation "temporary"

NOTE, these are all BK files, and will not be LISTED when you do a FILES-REPLAY command, but they WILL replay if you enter the .BK extension...

I will take these inputs and ADD TO my big TORCH.HST file and all cities that have coverage will show as a LIGHTHOUSE and those without will show as small dots. I am not posting this file until I get the first round of inputs. I ALREADY HAVE made the correlation between the current DIGI files and TORCH files, so do NOT send me data on those areas obviiously covered.... I need info on what is NOT in the DIGI files... Thanks!

P.S. I made a voice APRS contact via AO-27 today with N1QPR...
You probably need a gain antenna to hear the downlink... but you can hit the bird with a 5 watt walkietalke... (If no one else is transmitting, hi hi!_)

*** WB4APR REPLY COMMENT: In my humble opinion, 220 radios are too hard to find. THe BEST UNUSED Band in MY OPINION is 6 meters! You can find TONS of surplus single freq radios even at the 100 watt level for about $20 to $50 a piece at ANY hamfest. AND everyone knows that mobile coverage on 6 meters is FARTHER than 2m or 220 or 440.

*** Edited

I agree on the 6M idea and posted several messages on that same note about 3 months ago. I think a total of 3-4 stations across the country replied about 6M activity! My ideas on 6M are as follows but do not get the wrong impression, I am playing the devil's advocate here.

a) These radios can be found cheap, but add crystals and a large enough power supply, God help you if you need elements and the price is not so cheap.

b) If you are lucky these 6M radios can be a great deal but do not get in over your head! Know what you are buying BEFORE you pull out the cash. Make sure you find the right "cut" radio for 6M use. Some low band rigs are "cut" for the 30MHz region and all you will be left with is A LOT of component changes for 6M or a wonderful radio for 10M FM!

c) These radios are not small by any means. The only exceptions are Uniden Force mobiles. Even the trunk mount version is small and will give you 120W with ease and the front mount version is the size of your average CB and can supply about 60-70W output (only limited by the heatsink). Some of the commercial sites will only allow you a certain amount of room, this is the case with our local NODE stack at a cable TV tower. Make sure you have the room, take into account the 20+ amp power supply, TNC, and possibly some sort of cavity in case you QRM someone or someone is QRM'ing you.

Now that the negatives are all gone let me say that I think 6M is a great band and I really enjoy it when I get on there. I do disagree about coverage on 6M, it depends on the situation at hand, I have been able to stay in contact on 2M simplex at times farther than on 6M. You need power and a good antenna on this band to make it work as a backbone. 220 MHz simplex will probably be either equal or even greater depending on your antenna. 6M antennas are LARGE, and loaded antennas perform quite poorly. You can get a lot more gain out of a 220 MHz antenna than a equally sized 6M antenna that is probably why we end up with greater range. 220 Radios are expensive and more fragile, why does anyone want all those features for a plain old digi ?? This is why I would lean towards 6M over 220 but not really for any other reason.

If you do consider a 6M digi or backbone PLEASE look at the Diamond X-2000 vertical antenna and a appropriate triplexer like the MX-2000D. I own 2 of these antennas and one has been working very well for over 3 years with the other in use for 1 year. You get 6M/2M/440 coverage out of one fiberglass antenna and feedline. This feedline/antenna savings will probably pay for the hardline you will use on the digi! I hope you are going to at least use 9914 if not hardline

at the site ???
If you go the 220 MHz route look at Diamond's other model that will cover 2M/220/440. Right there you have the ability to run a WIDE on .79, a backbone on 220 MHz and a UHF repeater at the same site where all the local APRS users can chat!

If you still want to give 6M a try look for GE: Master EXEC II or Master II's Motorola: Mitrek Uniden: FML Series. These are the best bets for amateur use but beware of the frequency range, 2 low band models can be quite different from each other and on low band it is even worse. Operational Bandwith is quite narrow this is why my FML 120W Uniden cannot operate on 50.62 AT ALL while it is a killer on the repeater portion of the band. Be also aware that most Uniden radios are EEPROM programable. This is great since you do not need to buy crystals but if you can't find someone with the SPECIFIC programer you are out of luck. Uniden makes 3 programmers and all shops do not necessarly have all three. The average price to program a chip unless you know someone is about 1/2 Bench Labor Hour = $30-$40. Personal expirience shows that the Master EXEC II at 40W $50 + Crystals and a Uniden FML Trunk Mount 120W 36 Ch EEPROM programable at $150 in good condition plus programing are very good choices. The GE is bigger but draws less current so keep that in mind.

Let's hear from others, let's get the train going guess it is time to decide on a 6M frequency also (Will 50.62 ruffle anyones feathers like all the other choices we have made ?) and get it coordinated.

Has anyone thought of (if it is even possible) of tieing both a 2m (145.79) and 6m (what freq we going
to use 50.620?) to one tnc? This will give an inexpensive gateway and everything from one band goes to
the other and visa versa. Most times I don't see this as a problem except when 6m opens (I actually see
it as a benifit as I always have APRS running and will see the opening and in what direction so I can
get on 6). I've heard it is possible to tie 2 radios to one tnc in this manner and with the cheap 6m
rigs available it would allow you to have a WIDE with both 6m and 2m so mobiles can run 6m and be seen
by the 2m home stations. Any thoughts on this good, bad , or indifferent?

Bob for your information our local ARES group may get a donation of 20 -30 mobiles and 14 base units (to
 set up as 6m wides). As EC I hope to see them go into APRS use for the 1st widespread 6m APRS/packet
network around. Haven't got them yet, but will let you know. Also, hope to have a full time 79 WIDE up
in the TX panhandle soon, looking for a sight.

Hi Rich,

I am very interested in running 6 mtrs up here in FN05
country. I have an Icom ic-551D as well as two Mitrek. I
am trying to set up here at my qth. I was running  the
icom on 50.620 at 90 wts thru a 2 elm. quad. Now I have a
hygain 6mtr beam as well but it is down at the moment.
Also I have just received the horizontal elm for the quad
so I can work both vertical and horizontal. If we are on
50.620 what is everyone running on? FM/USB/LSB

Lets get this going.

I have been begging and pleading to get people to REPLAY DIGIEAST.bk and
DIGIWEST.BK and send in any missing digipeaters.  This is getting serious
with the Olympic TOrch run less than a month away.

I compared the TORCH run to these lists and we only have 40% coverage.
BUT THERE ARE OBVIOUS MISSING DIGIPEATERS IN THESE FILES.  I Know there
is activity in these areas:

Portland, Seattle, COlorado, Utah, Arizona Dallas, IOWA
Michigan, Wisconsin, New England!

But there are no digipeaters shown for any of these areas..
PLEASE SEND IN YOUR DIGIPEATERS....

But Please send in ONLY what needs to be added, dont make me have to
figure out what is new and what is old....

I'll jump in here a sec.....
  I have a question, I'm new to APRS since Jan. and I have gotten a
Garmin 45. I also have a KPC3 connected to my mobile and laptop.

        This is going to sound like a really dumb question, but since I
haven't seen it stated specifically, I will ask, A GPS unit, does it plug
into the TNC (have KPC3) or into the computer? I currently have a laptop
with a single serial port. Does it share the port somehow?
        Also, I have heard there is a diagram/schematic for a DUAL connector
setup to plug a GPS and TNC together. Does anyone have this if it exists?
If so, could you e-mail it to me?

Many of you have asked where to get crystals for the Maxon Transmitters
that have been on the SIG.  Although they are available from nearly all
crystal suppliers, I have bought them from the following:

                                        Marden Electronics
                                        1 (800) 222-6093
If you specify for a Maxon CP-0510
you will get the right thing.

Al Chan - W6DNT sez:
>
> Accuracy of altimeter is only plus or minus 100 feet. Is that good enough
> for the purpose? What are the requirements for "non-precision" landing?

For CAT I precision approaches, you usually see minima of 600 and 1/2 mile.
>From the decision point, you visually guide the aircraft in for a landing.
+/- 100 feet is adequate for this job.

> The problem with ILS is that it is a pencil beam straight line, that doesn't

> be further developed in the future to augment vertical reference, equal to
> the precision of the ILS glideslope?

Actually, it's a conical beam that extends from the two separate transmitter
sites: Localizer is usually located toward the far end of the runway and the
glideslope is at the approach end.  The two are not colocated in frequency,
either.  Guidance is adequate to bring you somewhere into the Touchdown Zone,
which is 1000 feet long, and the width of the runway.

> I've heard that the Europeans are reluctant in accepting GPS because it is
> controlled solely by the DoD (U.S. Defense department or Pentagon.) It can

> argument?

This concern has been repeatedly aired.  It's real.  The Europeans ahave
investigated a variety of alternatives.  One of the best is to coutilize the
the Russian GLONASS system.

> What is Cat I minimums? About 600 feet? Who financed WAAS? How many WAAS
> satellites are required to cover all of contiguous United States? Are these
> satellites geosynchronous? I understand the GPS space vehicles used to be
> geosynchronous. When did they change to non-synch?

WAAS is financed by the FAA.  2 satellites can adequately cover the CONUS,
```

although if I can recall, 3 will be used. As I remember, the WAAS satellites are in a geosynchronous orbit.

The GPS SVs were _NOT_ designed for a geostationary or geosynchronous orbit. One major reason is the amount of signal needed at L-band to meet the GPS user segment requirement for minimum available signal levels. a Medium Earth Orbit altitude was better suited. Further, you gain some degree of utility by having the satellites appear to move around a bit. In command and control.

> The Norwegians are using their FM broadcasting band (the band we use for

> well around automobiles, motorhomes, and yachts close to land.

Because the US Gov't had not committed to making DGPS a free service. A couple of companies are offering DGPS correction services at various levels of correction available as a fee for service issue.

And NO that would *NOT* serve the purposes of WAAS or LAAS because the requirements for accuracy and redundancy, error detection and correction, would be lost.

759. ZDNet News Flash!

From: ZDI Software Library Temp <ZDI_Software_Library_Temp@zd.com>
Date: Wed, 27 Mar 1996 13:36:31 -0400 (EDT)
To: aprssig <aprssig@tapr.org>
Message-ID: <9603272155.AA1542@mail.zd.com>
Rendered body type: text/plain

Attention all software developers! There is a lot of activity around ZD Net's software libraries this month as we launch two new editions on AOL and the Web, and prepare for our third annual Ziff-Davis Shareware Awards program.

Today, we're excited to announce that the ZD Net Software Library went live on the Web. The URL is:

http://www.zdnet.com/zdi/software/

If you'd like to read the full press release, please visit the following URL:

http://www.zdnet.com/zdi/software/news/prlaunch.html

We invite all shareware authors to visit the site and see what a great resource we are offering to Web users, free of fees or registration requirements.

We expect this move to significantly increase the exposure of the library -- and therefore of your software programs. The ZD Net Software Library is far ahead of other resources on the Web: its the only library that carefully screens, rates and reviews each program, selecting only the best to appear on the site. In addition, usage of the ZD Net Web site increases between 10 and 20 percent monthly. According to our February activity report, ZD Net received 10.4 million page requests and more than 700,000 unique Internet hosts accessed ZD Net. See the press release attached below for more information.

Just last week, we launched a consumer-oriented edition of our shareware library as part of our ZD Net/AOL Edition launch (Keyword: ZDNET). Already, thousands of people have registered for this edition of ZD Net, and the download shareware library is the most heavily used part of this site.

Finally, the deadline for the third annual Ziff-Davis Shareware Awards is quickly approaching. Although submissions are not required this year, you may want to check our library to make sure that the latest versions of your pro grams are available. You can also read about the eligibility requirements at the following URL:

http://www.zdnet.com/zdi/software/zdawards/zdawards.html

We look forward to continuing to expand the reach of the ZD Net software libraries, building on our reputation as provider of only the best available software titles, and we look forward to working with you to obtain your latest and greatest shareware and freeware programs. It is your hard work that makes

```
our software library such a big success.

As always, thank you for allowing us to distribute your programs.

-Scott Arpajian
 Acquisitions Editor, Software Library
 ZD Net

>with a single serial port. Does it share the port somehow?

YES or add a second port  (I installed a PCMCIA serial port in my MAC PB-540 )

A GPS plugged into a TNC is called a GPS tracker. No computer is needed.

For APRS use with a GPS, the GPS data is routed to the computer.
best if you have an extra serial port but a smart switch (HSP) will work.

>        Also, I have heard there is a diagram/schematic for a DUAL connector
>setup to plug a GPS and TNC together. Does anyone have this if it exists?
>If so, could you e-mail it to me?
>

anyone interested in the single port problem and using a GPS with a
laptop might want to read the following three files in the APRS Doc's

Bob must have spent many long hours writing and collecting this information
we all might want to take another look at the README text files.

------------------------------------
File name in the APRS documentation    "GPS.TXT" in  readme directory

HARDWARE SINGLE PORT MODE  (HSP)  FOR USE WITH ALL GPS UNITS:

     APRS can control the switching of the Single Port Mode between the TNC
and ANY GPS using the handshaking lines of the COMM port and a simple two
transistor switch soldered into the serial port data connector hood.  This
mode is called the HSP mode.  In this HSP mode, APRS periodically toggles the
DTR output of the serial port for a second or so whenever it needs data from
the GPS.  With DTR held high (normal) the GPS data is shunted to GND while
the TNC operates normally.  When APRS toggles the DTR low, this holds off
output from the TNC, but also enables data through the emitter follower from
the GPS.  As soon as APRS receives the GPS data it needs, it restores DTR so
the TNC is connected for normal APRS operations.  In some TNC's, (PACCOMM)
the RTS is used instead of the DTR for holding off TNC data.  Also, this
circuit uses your PC RTS line to derive a cource of +V.  If the impedance of
your PC RTS line is not strong enough, you might need to get it from the TNC's
DSR line.  REMEMBER THAT YOUR TNC AND GPS MUST BE SETUP AT THE SAME BAUD RATE,
```

usually 4800 baud.

File name in the APRS documentation   "HSP-BUGS.TXT" in readme directory

HSP-bugs.txt 7.3a   APRS HSP Port Switch

If You Have Difficulty Getting the APRS Port Switch to Work There are two common problems to look for: The unit is not getting power or the GPS signals are at too low a level.

File name in the APRS documentation   "DF.TXT" in readme directory

DIRECTION FINDING IN DF SINGLE PORT MODE!

Since we have just about concluded that you need a manual push button for the operator anway (thanks Joe Moel, K0OV), it becomes trivial for us to add the DF serial data to the existing shared GPS/TNC/HSP serial port. The following schematic shows how the serial data from all three devices is switched and how a second pair of contacts is used to alert APRS, when the DF data is connected.

Rendered body type: text/plain

FM Steve and I think that a presidence should start with VERTICAL polarazation. The reason is that FM is usualy vertical and the idea of 6M is not so much for a Operational Band, which it can be but more for Linking distant digi's. Due to this fact and the probablility of this equipment residing at a commercial tower or building Vertical is the only way to to and also Omni. For you in the fringe areas to the North a beam may be a good idea but for "WIDE Local" coverage Omni is the only way to go.

Again as the last time I brought up the 6M idea I am really interested and can operate 6M almost 24hrs a day. If the band is open I will move over to voice but I can leave the radio on .62 all the other times. I will not be able to join anyone untill I find the modification to make the Uniden cover the complete band. I do not want to lose the FM Repeater coverage and even though I have 50.62 programed in the radio it will not lock up unless I modify it.

Don't forget as I do Bob that not everyone has Internet mail and may not be reading these messages. Even if the APRS users in the area have Internet some

may not know of the sig or have unsubscribed. We all must admit it is a busy sig
and a lot of the mail does not interest everyone, many chose to not receive it
due to that.

Maybe a few phone calls to the regestered APRS users you have in your database
in those areas will get the fires going.

Why would broadcasting the differential (GPS dither correction)
signal through a subcarrier of an FM station any different than
going through a regular stand-alone ground station? Many of these FM
stations have high power 10 kilowatt transmitters. The correction
signal would be piped to the FM stations through telephone lines.

This would save money in the construction of hundreds of stations for
the LAAS.

How often is the dithering? Is the actual position continuously
changed? Or is it static for a period of time. How many times in a
period of one second is the actual position dithered?

CG> This concern has been repeatedly aired. It's real. The Europeans
CG> have investigated a variety of alternatives. One of the best is
CG> to coutilize the the Russian GLONASS system.

Is the Russian GLONASS system also dithered? If not, why not? Does the
Glonass also have about 24 satellites?

I've answered these questions before on the list.  I'd suggest that, if you've
further questions, we take them off to e-mail.  IF there's list-wide interest,
I'll summarize later.

There are a number of differences.
1.  The FM station controls the transmitter and subcarrier.  The FAA does not.
2.  The FM Station is optimized to transmit its signal to the ground, not the
air.
3.  The FM station has little concern for multipath and the associated timing
errors that could be incurred.
4.  The subcarrier system is bandwidth limited and cannot transmit real high
datarates.
5.  The FM stations are frequently 100kw ERP... and that incurs its own
potential for interference in the sky.

> This would save money in the construction of hundreds of stations for
> the LAAS.

Too many associated technical issues (I prefer to not use 'problems' here).

> How often is the dithering? Is the actual position continuously
> changed? Or is it static for a period of time. How many times in a
> period of one second is the actual position dithered?

The theory associated with Selective Availability is more complex than you are
appreciating here.

> Is the Russian GLONASS system also dithered? If not, why not? Does the
> Glonass also have about 24 satellites?

No it is not.  Because they did not have the technology available to them at
the time.  GLONASS uses a different geometry than GPS to get similar results.

773. TORCH PLANS!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 27 Mar 1996 23:12:22 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960327231112.18973A@greatlakes>
Rendered body type: text/plain

```
Here is the game plan:

Torch run begins in 30 days or so from now!

An Olympic Chase vehicle will have a 50 watt APRS stand alone tracker.
It will NOT have HF.   We are dreaming about a PACSAT uplink, but
this is only a dream at this point..

1)  The complete route is in TORCHW,M,E,SE and GA.bk.  If you LOAD
    instead of REPLAY these files, you will see on the P-LIST that
    some of these legs are via TRAIN and other strange forms of
    transport...  If we want to have coverage on the TRAIN, we may
    need an APRS HAM to jump aboard with his OWN tracker and ride along.
    (Boats too)

2)  We need a CALLSIGN!  Does anyone have the time to get us a special
    event callsign?

3)  We need a list of APRS VOLUNTEERS along the ROUTE with Phone numbers
    so we can remain in close contact

4)  *** ***   We need a VOLUNTEER TO maintain THIS LIST FOR US. *** ***

5)  I am assuming that there will be some APRS volunteers that would
    be willing to spend a day "trailing" or "Leading" the entourage
    to provide MOBILE digi coverage in sparse areas...

    THe Torch TNC will beacon via 4 paths something like this:
        WIDE,GATE,GATE,WIDE
        RELAY,WIDE,GATE,GATE,WIDE
        RELAY,WIDE,WIDE,GATE,GATE,WIDE
        WEBER-1   ?

Have I left anything out?  But NOW we need that volunteer LIST
coordinator... (and callsign-getter).  And if you are going to
volunteer to RIDE the train(s) or Boats, you will probably need
to develop your own local contacts...
```

Again,   the torch  BMP file is a windoze wallpaper file of the torch relay
map.  For those with Windoze, it goes in the Windows directory and is
selected as desktop wallpaper.

I have been able to produce rs 232 output from the $170 wx station
from Marine west.  The interface is basic stamp.

I am going to try it on the aprs program after I send Bob some money
to enable me for the wx option.  I will also be looking at the output
from the peet unit this week and comparing notes.

It looks like its gonna work...
```

I can also enable the unit to turn on any other device that
you might want to turn on during a wx event. ALSO, can get it
to dial a number if you should desire...!! ANYTHING ELSE you may want
let me know. Im rewriting the code tomorrow.... Again this suggests that
we can get a wx monitor and multi purpose interface for about $200.00
Additional application ideas are invited. This worked out quite well....

#2   This isnt related to aprs directly....though it concerns my HF tracker.
I ALSO noticed in this marine supply book at ICOM AT 130 tuner.
ITs only 350 bucks...The ICOM tuner for hams is quite a bit more.
Anyone know why the diff in price, and if it will work with a non marine
ICOM radio ?   I might buy one and just try it but had hoped for a
suggestion from you guys...   Now, to figure out the HSP !!

FYI Marine catalogs are FILLED with goodies...
SOLAR CELLS, Wind turbines, batteries, even neat electrical stuff,
(like paint on black electrical tape !)   Its neat to page through it and
look at GPS'S, wx stuff, marine electronics etc...Sometimes it can give
you ideas....For example, Id love to find a remotable flat color monitor I
could hang on the car dash for my aprs journey.. just like those fish
finders or radar screens....

ONWARD !!!
Mike

From: ZDI Software Library Temp[SMTP:ZDI_Software_Library_Temp@zd.com]
Sent: Wednesday, March 27, 1996 7:17 AM
To: aprssig@tapr.org
Subject: [APRSSIG:7911] ZDNet News Flash!

Attention all software developers! There is a lot of activity around ZD Net's software libraries this month as we launch two new editions on AOL and the Web, and prepare for our third annual Ziff-Davis Shareware Awards program.

Today, we're excited to announce that the ZD Net Software Library went live on the Web. The URL is:

http://www.zdnet.com/zdi/software/

If you'd like to read the full press release, please visit the following URL:

http://www.zdnet.com/zdi/software/news/prlaunch.html

We invite all shareware authors to visit the site and see what a great resource we are offering to Web users, free of fees or registration requirements.

We expect this move to significantly increase the exposure of the library -- and therefore of your software programs. The ZD Net Software Library is far ahead of other resources on the Web: its the only library that carefully screens, rates and reviews each program, selecting only the best to appear on the site. In addition, usage of the ZD Net Web site increases between 10 and 20 percent monthly. According to our February activity report, ZD Net received 10.4 million page requests and more than 700,000 unique Internet hosts accessed ZD Net. See the press release attached below for more information.

Just last week, we launched a consumer-oriented edition of our shareware library as part of our ZD Net/AOL Edition launch (Keyword: ZDNET). Already, thousands of people have registered for this edition of ZD Net, and the download shareware library is the most heavily used part of this site.

Finally, the deadline for the third annual Ziff-Davis Shareware Awards is quickly approaching. Although submissions are not required this year, you may want to check our library to make sure that the latest versions of your pro grams are available. You can also read about the eligibility requirements at the following URL:

http://www.zdnet.com/zdi/software/zdawards/zdawards.html

We look forward to continuing to expand the reach of the ZD Net software libraries, building on our reputation as provider of only the best available software titles, and we look forward to working with you to obtain your latest and greatest shareware and freeware programs. It is your hard work that makes our software library such a big success.

As always, thank you for allowing us to distribute your programs.

-Scott Arpajian

Rendered body type: text/plain

The box in question may have analog information in it that can be converted by A/D chips but the formatting of the data is key here. The weather boxes that are expensive obviously have a small processor that

interrogates each sensor, formats the data to the 'string' that we see at
our RS232 cables, and starts all over again.

This is not a trivial conversion unless you are familiar with the 'stamp'
style processors or perhaps with the 8032 boards or processors, etc. If
someone were to do a conversion then perhaps they could make it available
to the rest of the world.

Strange. All I can see wrong with the version of APRS, as with other
versions, is the first line of 'inittapr.tnc' file. I have to comment
out the 'parity' line. The APRS program configuration wants to change my
parity, which I have set up before hand anyway.

Bob and other mapmakers using MK100K2A.EXE i run into something strange
making a grid of maps for the Nashville area. If i enter a filename of
TNNASHDE it will crash everytime, yet if i enter a filename of TNNASH it
makes the map everytime. It looks to me like in this version you cannot
use an 8 character file name (Just the other way from the previous
version where you had to use an 8 character filename). I wonder if every
one is having this same problem. By the way i also attempted to use a
format like TNNASH01 and it crashed with that also. The result is that
if i use a 6 character filname it's ok. What i ended up doing is to make
every map with the name of TNNASH and then renaming it to my 8 character
filename.

Forget the requirement for having HAMS ride the trains.  I just loaded up
APRSdr on my HF station, and for the next few days, it will DR the TORCH
along the route at TEN times actual speed (100 MPH).  It will be beaconed
at the nominal 1 minute rate of the actual torch.  We can use APRSdr during
the actual event to track the *SKED* as opposed to the *TORCH*.  So when
the TORCH is not making it, there will be an OBJECT to see...

Also, we need a PR volunteer.  Once we get the GO, we will need someone
to put out announcements to all Amateur Radio channels...

At 10 times speed, this test will still take 8 days!
The full TORCH run is from 27 April to 19 July...
```

Bob,

Here in Portland, OR we currently have no APRS activity. I need all the information I can get in order to have any hope of supporting the APRS activities with the Olympic torch.

I have some questions regarding the Olympic torch that I haven't seen answered.

- Where can I find out the exact route of the torch (which roads)? We currently have zero APRS digis and I need to put what resources I can come up with exactly were they are needed. I would like to test the route with whatever APRS network we come up with BEFORE the real torch comes to town.

- What frequency will the torch tracker be using (145.790?)? Can the freq. be changed as the torch moves from town to town?

- Will there be a ham in the tracker vehicle? If so, I assume he/she will be able to communicate with the local hams via the local repeaters? Do we (the locals) need to provide this ham?

- Can the locals provide a recommended digipeater path for each town in the torch's path?

- You said:

```
    The Torch TNC will beacon via 4 paths something like this:
        WIDE,GATE,GATE,WIDE
        RELAY,WIDE,GATE,GATE,WIDE
        RELAY,WIDE,WIDE,GATE,GATE,WIDE
        WEBER-1   ?
```

  How will the path be selected? The layout of my local APRS digi net needs to be coordinated with the digi path (don't forget, we don't currently have any APRS digis in Portland, OR). My goal is to get a mobile RELAY, a WIDE and a GATE running by the time the torch gets here.

APRS Special Interest Group

I downloaded the program and my validation number is 12976. I find the program very
interesting but have several problems. I also subscribed to the Wx program but don't know what that involves.
I have looked at most of the txt files but am unable to see the demonstrations. I seem to have the files but don't know how to use the Files-Load command. As I do not know anyone having the program it is a hide and seek problem.
My main concern is that I plan to do some traveling this summer in our Motor Home and am thinking of setting up the system in it. I would also like to use the GPS system.
I am trying to determine what exactly I need to achieve all this. I know for a start I will need a computer (12v or battery operated), but beyond that it gets confusing as some of the equipment can be combined such as the Pico Packet with GPS receiver by PacComm. The MFJ 8621.2 meter Transceiver, or a full TNC but which one?
I read an interesting article in The Good Sam magazine "Highways" It was about the use of a GPS system. They referred to the use of software DeLorme Mapping "Map Expert" or GPS Link II on a CD-ROM . How would all this fit in with APRS?
I possibly would complicate the situation further by wanting to use 2m for other than packet and also TCP/IP. I believe APRS uses AX25 and the TNC would have to have the KISS mode for TCP/IP .
At this point it is a case of costing out the equipment. I could put the equipment I now have in the Motor Home but I am sure my wife would complain about the space I would be using
My TCP/IP address is 44.56.4.47 AX25 N1FIN@WA1PHY.FN42JM.MA.USA.NOAM.

Hope someone can give some help.

```
            Jim Rose (N1FIN)
ps  I got interested in APRS first in the book 'Practical Packet Radio' by
Stan Horzepa.

Arte,

Please don't advocate doing this.  It was bad enough you lowered
yourself to the level of a mail-bomber already.  I suggest you send an
apology to the site's system administrator.

Spamming happens.  Get on with life.  Turn the dial.  All you are
doing is screwing the legitmate users of the network out of bandwidth
and wasting some poor system administrator's time dealing with the
garbage caused by his user.  Sending mail bombs like this is as bad if
not worse an attack than some misguided advertising and, on the system
my group runs (with 30,000 users), is grounds for losing your account
or worse.  Many system operators share this view, which may include
those of GNN.  Might I suggest:
  a. Ignore it.  You can be sure hundreds of people have already
     complained to the user's system administrator.
  b. If you feel you can't ignore it, contact your system
     administrator and ask her to contact the spammer's sysadmin.
  c. If it really makes you mad, write a reply nastygram, show it
     to a friend or co-worker, and then delete it without sending it.

Please followup to me in private (or on 06 tonite:-).  I'm CCing the
list only this once because yours is about the fifth piece of noise
I've seen on this group talking about ZD spam instead of APRS.

For that, I apologize for adding to the noise level.

797. MOTOROLA.exe

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 28 Mar 1996 16:48:24 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960328164501.3036A-100000@greatlakes>

Rendered body type: text/plain

```
At the request of Ralph Fowler, our Atlanta guru, I added a command to
toggle the HSP switch from within MOTOROLA.bas so you can command your
motorola GPS cards thru the APRS HSP adapter without having to move
cables around.  ALso I compiled it to MOTOROLA.EXE.  Only the bas version
will be in APRS distro, cuz the compiled version takes 46K instead of 7k.

Both files are in MOTOROLA.ZIP on tapr sig.

I dont have a motorola and someone walked off with my HSP switch at the
last demo, so these changes are untested....

WB4APR REPLY COMMENT:  The TNC will have 4 pre-programmed paths.
Hopefully we will pre-load it with the best generic paths.  You should
plan on making your BIG DIGI's be WIDES, and small gap-fillers be RELAYS.
```

Message-ID: <2.2.16.19960328204528.0d174328@mindspring.com>
Rendered body type: text/plain

```
I was making some 100k maps for a new station up in Anderson, SC and ran
into this problem with the latest version of the program that makes 1, 4, or
9 maps.    When I chose 4 or 9 maps and gave it a center point, I was
expecting the maps to overlap a bit.  I told it a 1 mile radius and it did
make the maps a bit larger  (1.05 miles, I think).

I thought I should really get a nice overlap, but instead I got a pretty big
gap between each map.

Anyone get this to work properly, or am I expecting or doing the wrong thing?

Thanks
Ralph

-----------------
Ralph i don't think your doing the wrong thing, there's no way to not have a gap
between maps in APRS Dos. At least at first glance you think there's a gap but if
you move the cursor along as if doing GPS tracking you will see that when the
cursor leaves one map it will continue on the next map without missing anything.
You are doing it right if it's going trough the whole 9 map grid without
crashing. just make sure you don't use 8 character filenames at least i have a
problem doing that with the version MK100K2A. I never use the automatic grid
ampping, i still find making a grid on a larger map gives you more control over
the complete map grid. Generally what i will do in a heavy populated area is make
1 mile maps wich turn out as 1.05 range, but when i list them in my maplist i up
the range to 1.9 or sometimes 2 mile range this seams to work out better for me.

Here's What I have for Iowa and it includes 1 site in wisconsin. I didn't
weed out the Illinois sites for you Bob (i'm sorry) I can also upload it to
TAPR (with the Illinois stuff out). Most all of the Iowa sites run WX but
have good coverage and the only HF gate is WB0BBM. K0BGP has the best
elevation @ 1009' above sea level. I also have a commericial site that loves
me and might negotiate tower space on a temp basis.
Sorry I took so long (198 messages were waiting for me) I've been sort of
busy. I sent this sig wide cause I thought some others might be interested
in were the darn APRS sites a hidden in the corn.

> expecting the maps to overlap a bit.

WB4APR REPLY COMMENT: No overlap at all. BUT you should consider these
maps to ONLY be a SOURCE of data for your NEXT steps:

1) NEVER use the .MAP results, they are useless. Use the .DAT maps.
Load them into MAPFIX23 and do a TASKS-SCRUNCH at 1.2. THen SAVE them
as .MAP

2) Look at the 9 maps. Most will be much less than 3000 points. Based on
their size, estimate how much larger you can make the 4 corners maps and
still be under 3K. CHANGE-CENTER inward toward the central map, CHANGE
RANGE to your best guess, then TASK-IMPORT the points from adjacent maps.

3) CHANGE-RANGE on the central map to make it overlap the other 9 then
TASK-IMPORT to fill it in.. You may be able to convert your 9 maps into 4
bigger corner maps and one central overlapping map.

4) THis is a theoretical example. Usually one area is very dense and
cant be made much bigger, while many others can... So you just
TASK-IMPORT until you get the overlaps you want.

5) Due to the 5% overlap and truncation errors, yuou will need to zoom in
and eliminate duplication where ever maps join....

We've seen this direct on VHF in the Tampa Bay area before too...
incredible   N4NEQ-3 is the only APRS station via VHF that I have seen
outside of Florida more than once.  (ie no gateways involved.)

The FCC has provided for this but I don't think they have started issuing
of special event callsigns.  Maybe the best idea is to apply for a club
callsign ie "Torch Run Tracking Amateurs ..." etc.  Or something less
specific?  Turn around on club calls is less than 3 weeks typically.

820. Wayne Green & Screen Captures

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 28 Mar 1996 23:59:23 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960328235105.5019A-100000@greatlakes>
Rendered body type: text/plain

```
Wayne (of 73 magazine fame) called the other night and wanted to know
what was this APRS all about.  I sent in the article tonight...
```

```
To make the pictures, I finally figured out how to use WINDOWS:

1) Run APRS from the file manager.
   Make a pretty map, hit PRINT SCREEN.  Quit APRS

2) OPEN PAINTBRUSH
   Select VIEW, ZOOM OUT.   (this is the trick to getting the WHOLE screen)
   Select EDIT, PASTE
   click below the crosshatch
   THen File SAVE

The result is an 880K .BMP file.  Which amazingly PKZIP's down by 99% to
only 14K!  All this is probably obvious to everyone who does windows, but
for some of us who only bring up windows occassionally, it might help...
P.S.  this was windows 3.1...
```

I am uploading two files. One named NASHGRID.MAP and NASHGRID.TXT to help
answer some of the questions on how i make my detailed city maps. The
NASHGRID is a map of the Nashville,TN area with a grid overlay showing a
grid from wich you can make any scale map and get the Lat/Lon for the
whole grid. Make sure you D/L the text file along with it. I hope this
will help some of you to make these maps. I'm not saying this is the best
way or the only way. All i'm saying this is my way and i have made
somewhere around 600 maps now and it works for me Hi. isn't this some
type of APRS WORLD BOOK OF RECORDS ENTRY Bob? hi...

Bill KE4EER
```

822. MapMakers

Bob that's not always the case, look at the DAT and MAP files if the filesize is the
same then the MAP file is ok. DO NOT SCRUNCH at all. Take a close look before and
after scrunching and you will see many road points have moved to a 45 degree angle,
you have to realy look close. This ALWAYS HAPPENS!.

Rendered body type: text/plain

I saw that Kantronics now hase ROM version 6.0N for the KPC-3 and KPC-9612.
This is supposed to give the KPC all the advantages of a TheNET node without
giving up any of the regular TNC feature (Like long unproto paths). Has
anybody seen/used this in a digi yet? I am considering this option in the next
digi I put up and if it works well may retrofit my existing digi(s).

73, Bruce

Rendered body type: text/plain

I may not have been clear when describing the problem I have.
I think that the centering that the Mapmaking program (the 9 map one) uses

to derive the map centers should be making the centers a little closer
together, (based on the specified range) so that the maps do not have blank
space between them.

If you let it make 9 maps and then do a Map Borders command, there is an
obvious gap. The gap carries thru to the maps themselves. I hardly ever
use the *.map files- most of the time i rename the *.dat files (if they are
not too large).

Maybe the problem is that the trimming part of the program cuts the
boundaries too closely. Maybe it is something I am specifying.
Has anyone gotten this program to work by simply:

1. Answering the questions and running the program for 9 maps (or 4)
2. Deciding whether to use the *.dat or *.map files and renaming them
accordingly
3. Having maps that adjoin properly with no blank area?

This would be a nice tool for "quick and dirty" maps of a small area without
too much effort and time spent!   If mapping a large area with lots of maps,
I realize other tools would be more appropriate right now.

Ralph

A totally off the cuff, un-thought out idea....

What if there were dual port (1200 baud on 2m and 9600 baud on 220/440)
nodes that were K-net nodes. And further more these nodes were used to route
between cities, such as say Chicago and Milwaukee. People in Chicago could
then put a Milwaukee node in their path, and the K-net node would "know" how
to route it. No fuss, no muss, and no GATExyz.

Now, tell me what is wrong with this....or have I been a sleep and this is
already in progress.

ANSWER:  If they are the same, then why take the extra step of looking
first.

> DO NOT SCRUNCH at all. Take a close look before and after scrunching
> and you will see many road points have moved to a 45 degree angle,
> you have to realy look close. This ALWAYS HAPPENS!.

WB4APR REPLY COMMENT:  I donno Bill, the .MAP results ALWAYS make these
truncation errors, and that is why the .MAP output should NEVER be used.
The MAPFIX SCRUNCH only eliminates duplicate and redundant points with
nearly the same slope.  It will never truncate and make the angles you
describe...  I suspect what you are seeing were in there before you did
the SCRUNCH.  Also, never use more than a SCRUNCH of 1.2...
```

WB4APR REPLY COMMENT:  We will be introducing the APRS MIC ENCODER at
Dayton (and have a prototype for Timonimu this weekend).  THis will
reequire a special APRS NODE at all voice repeaters.  I am working with
PacComm to develope this special APRS NODE and it will also have the
new WIDE-N routing schemes that I have been talking about for over a year...
THese will eventually need to be at all APRS digipeaters too to improve
APRS channel capacity by a factor of 3 or more, eliminate WIDE,WIDE,WIDE
dupes, and provide for DX routing...

 I cant promise anything...  but it is all in the works...
```

837. 75a "problems" on P5 system

From: "Art Smith" <ALS@CEIS.UHCOLORADO.EDU>
Date: Fri, 29 Mar 1996 09:46:08 MST-0700
To: aprssig@tapr.org
Message-ID: <B73D95C1207@ceis.uhcolorado.edu>
Rendered body type: text/plain

```
A mystery or two!

75 and 75a run fine in a Windows window, with the normal
windoze problems, on my Packard Bell pentium computer and
PB monitor, except that my new "energy efficient" monitor,
or something else, somehow senses lack of keyboard or mouse
activity and closes the open program.  I am left with an
APRS icon at the bottom of the screen, which is still on,
not blanked or off in "energy saving mode".  I have all the
energy saving features of the computer and monitor turned
off, and there are no screen savers running.

75 and 75a will not run from DOS on this computer, either by
closing Windows or from a minimized DOS boot disk.  All I
get is a small round graphics symbol in the upper left
corner of the screen that looks like the cursor after the
program is open.  The computer then locks up.  A
CTRL-ALT-DEL does not work, a power off reset is required
to restart the computer.

The computer is a pentium 60 with 8 mb of ram, SVGA card
with 1 mb of ram, 256 k cache, 640 mb as C drive and 1.4 gb
as D.  There is a "Sound Blaster" audio/cd card and a
"Sound Blaster" labeled CD.  The new monitor is a new PB
15" SVGA with energy saving capability.  My old Compudyne
monitor went up in smoke so I cannot reinstall it to see if
the new monitor is the problem.  I have connected the
monitor to my old 386-16 notebook, and everything works OK
in both DOS and Windows.  I have tried changing screen
configurations: 640x480, 1024x768, 16 colors, 256 colors,
etc. with no change in the problem.  I have reloaded 74 and
74to75 and 74a from TAPR, then PKUNZIP -d each.  The 74
with 74to75 and 75a all have the same problem, the only
thing that occasionally changes is the graphics character in
the upper left of the screen. With 74to 75 it looks like a
briefcase on end with a handle on the left side, centered.
 With 75a direct, it is an open circle, just like the map's
cursor.

Suggestions please!

I need to get this problem solved so the system will run
when I am not at the keyboard before the torch gets to
Denver!
```

> Ralph---------------------------------------
Actually i did a straight reply to this message to Ralph when i noticed
```

he said TELL US.

By the way to understand what i'm talking about you may want to down load the files NASHGRID and NASHGRID.TXT for Tapr.

Well here it goes.
First i take a 2:000.000 map of the area i want to make detailed maps for. Load the map and resize the range box by hitting ALT-R and entering 1 mile for the range. Now move this white box to the uppermost corner of the area you want to cover, do this by moving the cursor to that point and hitting the ALT-C key for centering. Caution this is for MAPFIX18.EXE only. Now that you have the 1 mile square white box on the upper left zoom in to the 2 mile level (Or as close as you can). Place the cursor on the left vertical line of the box and hit ALT-N to draw a line, I normally use one of the lower numbered colors bbecause they show up better. Now move the cursor all the way down the map and hit ALT-A to draw that line. Now also do this for the vertical right line of the box. Before you move the box also draw a line for the top horizontal line of the box, and also the lower horizontal line of the box. This should give you the first box of your grid. Now move the white box to the right using the cursor and the ALT-C key untill it lines up with the next vertical line. At this point it doesn't matter if the box moved up or down somewhat. Keep repeating this untill you have a series of vertical lines covering the protion of the map you want to work with. Now reposition the box to just below the upper left box that you drew first and repeat drawing horizontal line using the above instuctions. When comleted you will have a ggridwork of one mile range boxes all over your map. This is what you will use to make your maps. To see how you use this grid download the file NASHGRID.MAP and NASHGRID.TXT it will explain how to go from there. Caution: Once and a while hit the CTRL-S to save your gridmap, the software has been known to crash and loose all your work hi.

I hope this explains the process clear enough, i'm not a writer so if you see something that isn't clear let me know and i will try to do better.

Yes i'm sure he knows where N4NEQ-3 is at. How can anyone miss that digi. By the way to see all activity in Tennessee all i have to do is point the beams at N4NEQ-3. there are a couple in Tennessee that are ego digi's tough, you know the once i'm talking about. In fact i have found doing some testing that i can hit most users in Atlanta going trough N4NEQ-3, i know that's the long way around but it works. Like i said N4KMJ-7 is useless to us here in North Alabama, in fact it hinders ud in the sence that we can hear everything it beacons but it can't hear us at all. Ralph let me know on the map thing.

i end up on several trips a year from EN57rc into the population zones (anywhere else but here...) The last one through Chicago had me in extasy -- i could see more than me on the APRS screen!!!

after seeing all the comments on this sig about keeping the digi path as short and specific as possible and then seeing this batch of rather wide paths, i am confused......

when i am mobiling locally, i can understand using a specific path to disseminate the position reports to the specific area i want to hit (there's only one other person running APRS here), but what should i do when making a 600-800 mile trip through 'populated' areas? do you guys in california really want to see me driving from chicago to st louis??????

Clinton Will Let Businesses
Widen Use of Satellite System

By ASRA Q. NOMANI
Staff Reporter of The Wall Street Journal

WASHINGTON -- President Clinton is expected to sign a directive Thursday, phasing out restrictions that the Pentagon had placed on civilian use of the government's sophisticated satellite-navigation system.

The new policy, which would grant expanded use of the system to U.S. airlines, auto makers and other commercial enterprises, is expected to be unveiled formally by Vice President Al Gore Friday. The satellite technology can pinpoint the location of users anywhere in the world, from the skies to golf courses.

The Pentagon's restrictions, based on national-security concerns, have limited the accuracy of the satellite-navigation system, reducing its uses for civilian purposes and raising a concern among potential foreign buyers that the military's control on the technology was too tight. The new policy follows a recommendation from Rand Corp., which estimated the satellite-navigation industry is likely to grow to $8.5 billion a year by the end of the century from the current $1 billion.

The policy shift ''will be a huge boost to business,'' said Frank O'Mahony, a spokesman at Trimble Navigation Ltd., a leading maker of the small, portable radio receivers that are used to pick up information from a 24-satellite network, enabling the users on land, sea or in the air to pinpoint their exact location. For example, drivers can figure out how to avoid traffic jams by using car-navigation systems based on this technology.

The announcement isn't likely to mean much to the makers of satellites, because the U.S. and commercial users will continue to use the 24 satellites that are already in orbit. Other potential commercial beneficiaries on the ground include Rockwell International Corp., Sony Corp. and General Motors Corp.

Another important feature of the new policy is that it apparently rejects proposals that the U.S. charge fees to users of the satellite technology, which started in the 1970s as a Defense Department project. Prepared by the White House Office of Science and Technology Policy, the policy means the U.S. will continue upkeep of the satellite system without curbing or charging for commercial use.

A White House official said, ''This new policy will do a better job of balancing national-security needs with civil and commercial-sector uses'' for the satellite-navigation system.

''It's long overdue,'' said Marvin White, general manager of the commercial division of Etak Inc., a Menlo Park, Calif., unit of News Corp., which sells the technology to users such as ambulance services in Albuquerque, N.M., Kansas City, Mo., and Baltimore. Other Etak customers include the makers of car navigation systems such as Motorola Inc. ''We would be delighted'' with a phase-out of military restrictions on the signals, Mr. White said. ''That would make using maps and navigation equipment less expensive,'' because users would need one receiver instead of two receivers to unscramble satellite signals.

The Federal Aviation Administration and U.S. carriers are expected to increase use of the system for air-traffic-control needs, and are already experimenting with it in the Pacific. UAL Corp.'s United Airlines and others have been investing in the system for their flying operations over places such as Russia and China,
where language difficulties often hinder air-navigation efforts.

Car rental companies such as Hertz, Avis and National have already been experimenting with navigation systems. ProShot Golf Inc., Newport Beach, Calif., just signed a deal with Trimble to develop advanced satellite-navigation parts for golf products; already, it uses the technology on golf carts to tell golfers how far they are from the green.

> Actually you shouldn't do any trimmimg Ralph, unless the map just has to many
points. Also like i stated here before you don't have to use only the .DAT files.
If you look at both the .DAT and the .MAP file and if they are both the size, lets
say 26486K then the original .MAP is perfect and you can safely delete the .DAT
file!.

> 1. Answering the questions and running the program for 9 maps (or 4)

There are more appropriate methods to deal with SPAMming than to harrass the individual who sent it. Send a POLITE note to postmaster or root at their

system, and see what happens. In virtually all cases, I've gotten a polite
response, with an "Oh, no! Tell me (s)he didn't really do that! I'll deal
with it!" attached. And no more SPAM.

The exceptions are the folks who are spamming, know it, and are doing it to be
annoying... or worse. Most of those, nowadays, are using faked address info
for the From: and Reply to: lines, as well, so it takes some further detective
work to figure out who they are and how they're getting in. IN this case, a
polite note to the root of the system they're apparently from will get that
group and other, appropriate groups involved in figuring out who's at fault,
and dealing with it.

I have to agree with you Bob. Altough i never use that function i just made a
grid of 4 maps and it does overlap perfectly. What Ralph is doing is trimming
the maps and this gets rid of the overlap that's needed. But Bob i dissagree
with the fact that when you do an overlay that only the portion in the white
box shows, OOPS just remembered that you are using Mapfix23.EXE and i'm using
Mapfix18.EXE (Sorry). In any case don't trim your maps if you don't have to, it's
better to make the range a little smaller so you don't have to. By the way the
grid of 4 maps i just did i listed them in the maplist at a 2 mile range, and
when moving the cursor from one map to the next the cursor was never in a dead
space so should work great. By the way out of the 4 maps i had to use 4 .DAT
files yet only one was beyond the 3000 point limit (3125) showing the program has
problems.

>california really want to see me driving from chicago to st louis??????

It depends on if there is anything else going on at the time. We like to
see things MOVE. The little houses get boring after awhile.
The torch is different. We feel that it is of enough interest that more
than the locals will care where it is. It also gives us something we have
never had before in APRS. A constantly moving target on a 15,000 mile trip.
If the signal makes it back here to Atlanta, you may just see this APRS
screen featured on a *WELL* known World Wide Web page too.   If the TNC had
more path options, we'd probably use them too.

By the way, on my recent 2 month Florida mobile trip, I was quite often in
areas without good digi coverage. I used the Alt Path command in APRS to
beacon 50% thru Relay,Wide and 50 % thru Wide, Wide   with Gates and
the home digi in Atl. thrown in as well if I was within a hundred miles of a

GATE.   Had to make sure Bill, EER could see me on his gate   ;-)

No they don't Bob, take a good look at a mapfile with no scrunching, then scrunch at
1.2 or even 1.1 and look at the map very closely, you should see many points that have
changed. For this reason i never ever scrunch a map. Look at some of my maps and you
won't see any of the angled points because i don't scrunch them. It's hard to bring
this point accross of what i'm seeing in the maps but if required to prove the point i
can send you some samples.

Just for the record-   I *am not* trimming the maps.  The mapmaking program
is doing it.   I used only the *,dat files, because they were all small
enough to not need that final step.    If the mapmaking program is doing any
trimming *to create* the   *.Dat files, that is where the trimming is
getting done.  I'm not doing it.    I'll zip up the Anderson SC stuff and
put it on TAPR for Bob and Bill and y'all can see what I mean.

Personally I find the one message about a neat shareware site
acceptable to a place devoted to only one piece of shareware. We hams
on APRS frequently use other shareware in conjunction with APRS.
How about them screen grabber type programs we capture APRS pictures
with? The generation of 7 of 8 counter messages including this one
is a waste of time. I almost dont want to mail this it will probal.ly
generate more petty bickering, but what the hay we have proved,  petty
bikering is 15% of this sig anyway, so it must be acceptable.
This is my opinion and possibly yours too ha ha...

> Bill KE4EER

Gee Bill, I "Alt S" all the time - usually 2 to take out duplicate points or 1.2 to smooth some lines. But then I also go through afterwards and check each line and point and take out the angled points. I guess that's why I only have 250 maps to your 500. <GRIN>

BTW - I uses mapfix 18 too. I tried the new version and the command structure threw me for a loop. (Old dogs - new tricks ?)

Bob (APR)

Having watched the all of the lobbying on the SIG for that Pick Up Truck symbol I would like to put my request in. I am planing to have my GPS attached to myself at Dayton this year. That way my partner can just look at his map to see what booth I'm at, when I find him a good deal. The problem is that there is not a symbol for "me". Bob, would you make one. I am 5'9", 180 lbs, blonde hair and blue eyes. I'm not taking my dog, no need for a leash and dog symbol. You know I bet there are others that will be doing the same thing. Since Hams come in all sizes, maybe you should make several. Oh! what about women ? Better make one of them too. Make her 5'8", 120 lbs. 36-25-35.

```
    If Found, Please Return To:

Might I suggest at least a "D" cup? That might be a good direction pointer for
where you're going! (shame on me!)

```
Bob and other MapMakers, found another bug in MK100K2a.EXE. You know the
problem i told you about when overlaying a map in Mapfix18 and it then
crashing and locking up my computer. Well the problem is like i believe
you mentioned Bob that there's something wrong with the map itself, that
is the case it doesn't have the last line wich should be (0, -1).
The reason that last line isn't there is when you use MK100K2a.exe and
you enter a filename of 8 characters it may build the map but leave out
that last line, then when importing that map the PC locks up. After
editing the mapfile manually and entering the (0, -1) as the last line in
the mapfile it didn't crash!.

The perils of making maps Hi.

It seems to me that all this fellow needs is a Sale Tag (shaped like
his signiture tag) with a "$" in it, and he only turns on his radio when
he's at a booth with a bargain. This way, he just stands around untill
his transmit light goes on (having sent out a beacon with his current
position), and everyone carrying their laptop will be able to zero in on
the bargain.

869. NIAN VHF/HF net

From: WB9WOZ@aol.com
Date: Sat, 30 Mar 1996 10:20:41 -0500
To: aprssig@tapr.org, winaprs@tapr.org
Message-ID: <960330102040_181442746@emout10.mail.aol.com>
Rendered body type: text/plain

*****REMINDER*****REMINDER*****REMINDER*****

The Northern Illinois APRS Net (NIAN) conducts a VHF/HF net on sundays at
2100 UTC (3pm CST)

Local stations are on 145.79
HF GATEs are
30 meters
10 meters on 28.105 LSB
and we also have a
GATEIL on 80 meters

The NIAN group discussed the procedures for operating

the net, got some input from Bob, WB4APR and figured that we would have
to revise things as needed. But here is how it stands now.

PROCEDURE:
Place "Checkin NAME & QTH" in POSIT string
when checking out place "Checkout NAME & QTH" in POSIT string
Windows users should send directed message, its easier then messing with
config file
Stations using GATEIL or GATE or GATE10,or GATE,GATE add N9RER-15 after
last GATE **NOT WIDE**
this way we won't tie up other nets

Since this is so new to everyone, and wanting to keep it somewhat informal
so as not to scare off prospective parties, we have come up with a few rules.
The Net Control station should be able to keep a rein on what traffic is
being passed. So, a combination of directed messages and BLNs will be used.
Net Control will issue two types of BLNs.
BLN1,BLN2,etc (numerical) and BLNA,BLNB,etc (alpha).
Numerical BLNs will show stations checking in & out. Alpha BLNs will show
traffic. I think that stations wanting to pass traffic for general knowledge
should issue an alpha BLN. Stations wishing to pass traffic to Net Control
only should send a directed message.

All this brings us to the reason why BLNs are used instead of more directed
messages. BLNs don't require ACKs, meaning less repetitive transmissions,
and less QRM.
A directed message needs an ACK. In the last net, I had no real trouble
replying to direct messages and watching the P list for new stations.
The Chicago area stations were sending direct to me. It was agreed that
Net Control should be the only station in our area using GATE in my path.

In short,
BLNA,B,etc(alpha) for general traffic
BLN1,2,etc (numeric) to be issued by Net Control
direct messages are ok, but less chance of getting through

Questions, comments, let me know
73s & thanks
Bruce Tobias

Just thought you guys would like to know- Bill EER popped up on the map
here in Atlanta from his home QTH over in Al A Bama yesterday. I did a
double take when I saw his pickup truck icon. "And I didn't see no beer
cans or no hound dog neither". ;)

When I saw the -14 on the icon, I had to zoom way in because at first I
thought that W7LUS-14 (Peter) had stopped off to see ol' Bill and that his
truck icon with -14 was covering Bill's house, but I guess all I saw was the
pickup in the sideyard.   That thing's not up on blocks, is it, Bill?

FYI

Excerpts from the Business Section of the Dallas Morning News
Saturday, March 30, 1996

EASED RESTRICTIONS TO INCREASE USES FOR NAVIGATION SYSTEMS
Asociated Press
WASHINGTON - The Clinton administration announced Friday it would loosen military security restrictions and allow greater commerical use of a global navigation system.

In a move that Vice President Al Gore said could turn a $1 billion industry into an $8 billion industry in four years and create 100,000 jobs - mostly in California - the administration said it can protect military security while expanding access to the system.
<snip>

Under a newly approved White House policy, the Pentagon will end in four to 10 years its practice of degrading the quality of the Global Positioning System signal available for commercial use...

While I'm delighted that they are going to turn off SA for the system (that is what they said, isn't it?), I must say I'm underwhelmed at the stated timetable. Since SA can already be simply and cheaply defeated by anyone who wants to take the trouble to do it, I wonder why the feds don't just turn it off and be done with it!

Also wonder why Gore thinks this will generate an $8 billion industry in four years if the new plan MAY keep SA around for 10 years?

'Tis a puzzlement!

No Ralph Peter didn't stop here, and no there's no hound dog in the back of the pickup. Bob said that's asking a liitle to much Hi. You should have realy seen me today then. Still no laptop tough, cable problems, no power going to pin6 may be it. Anyway got to take down a 7el 6mtr wide spaced Yagi so i can put up a 10el ATV yagi, the last few ATV nets i have been cheking in using APRS they told me that was a first for them Hi. (How about that Ralph). Well i have been pointing my beams at N4NEQ-3 the last few days!.

>73, Pat WA6MHZ
>ARRL San Diego Section Manager

Hi to Pat and the list,

I run a Northern CAilf PBBS and have recently got into APRS when a local
repeater owner put up the first of several APRS nodes for Marin Search &
Rescue work, tracking search teams.

The reason is that 145.790 is a VERY congested BBS freq in/around the San
Francisco bay area and
up into parts of Cent. Calif. These BBS systems have been here long before
APRS even came into Calif. and as such would not give up the freq. for APRS.
(I've been to the last several sysop's meetings for Northern Calif. where
there was a lot of negitive feelings about a FEW APRS users trying to get
many PBBS's (and alot more PBBS users)
to move. As a compromise, 145.010 was given to APRS as the least painful
solution for all. Maybe not perfect for everyone but it allowed the least
amount of "turf wars".

(My PBBS is NOT on 145.790. It's far enough north to be a hidden transmiter
to about 90% of the SF bay PBBS's.)

I'd also like to see a national APRS freq. but unless APRS users were there
first, (and they were not in Northern Calif.) it won't happen.

I'd like to open up some dialog on the POSSIBILITY of some group designing
and building a microsat-type of dedicated APRS satilight that could be built
that might allow users to use standard TNC's (like the KPC-3, etc) to
connect. Is this possible?

BTW- MY MFJ 8621 came rocked for 145.010. Hmmm. Wonder if MFJ knows which
way to go...

Thoughts?

TAPR will be posting the announcement on Monday (April 1st) concerning a
mass buy of Gamrin units. We have be finalizing the details the last few
days at the office and with Bob Bruniga, WB4APR and with the TAPR BoD.

Cheers - Greg, WD5IVD

Hi William, I too need to know of a source of board capatable with what
is required for APRS. Lets hope that is forthcoming in the newsgroup.

I have been attempting for about 20 hours (it seems) to get my KPC-3 and
Garmin 45 to work as a stand alone tracker...(I've previously had a
successful Magellan/DRSI tracker)

I have made the following settings on the KPC-3 with no results (the KPC-3
works fine in all other ways.

so not to prolong the agony the following settings are made:
ABAUD 4800
GPSHEAD 1 $GPGGA
LTP 1 SPCL via RELAY,RELAY,KB1xxx,WIDE
BLT 1 E 00:02:10
LEDS OFF
BT {1}
DIGI ON
UNPROTO APRS VIA RELAY,RELAY,W1xxx
INTFACE GPS
RESET
(power off  then on with the computer disconnected)

==COULD SOMEONE PLEASE TELL ME WHERE I'VE BEEN A BAD BOY?==

To: aprssig@tapr.org
Message-ID: <199603310238.VAA06429@moose.erie.net>
Rendered body type: text/plain

Bob,

Please explain how to read the baro pressure with a U-2000.

This is the explaination in WX.TXT file:
1420z876/36/45   Time,1420. Pressure 987.6. Wind 36 gusts 45

But on N3HPR's U-2000 (now working with 75a) transmissions, he
transmits B018 and his display says 1018 MB. No decimal.

Is it one decimal place under 1000 MB; and no decimal place 1000 MB
and greater?

Please fill me in.

TNX

Try $GPRMC instead of $GPGGA.

I have a Garmin GPS-50 and it does not have GGA but it has RMC. This may be ther
problem, but again the GPS-45 is much newer and may use GGA make sure you have
one or the other using the GPS connected to a terminal program to read the
output.

If I remember correctly all the Garmins have $GPRMC and not GGA. RMC is better I
feel since it will give you a course bearing while GGA does not. You got it, use
it! many others with Magellan's do not have RMC and wish they had!

>
```

Is it transmitting at all ?? will it xmit if you manually put data into the
LT buffer ??

ONE:

Is the Garmin-45 I/O setting set to
NONE/NMEA   or NMEA/NMEA
NMEA 0183 2.0   4800 Baud

TWO:
Does a volt meter on the TNC RS-232 input pin and ground Wiggle.
the GPS xmit may go to the wrong TNC pin.

------------- some hints ----------------------

I would do both RMC(speed, direction and position) and GGA (alt and position)

```
GPSHEAD
1 $GPGGA
2 $GPRMC

BLT
1 EVERY 00:01:10
2 EVERY 00:00:30

LTP
1 APRS VIA RELAY
2 APRS VIA RELAY
```

You need APRS in the string so most APRS software can see you.

Re-connect to the computer and Check the LT buffer to see
what the TNC saw from the GPS

Watch out for any extra spaces in the GPSHEAD statement as that is what
the TNC will trigger on.

------ Operations hints -----------------
you might try the Software CD setting.
CD SOFTWARE   so that local QRM will not put the TNC on hold.

Also turn off connections or you will get constant NMEA data flooding
if someone connects to the tracker callsign. This is not a problem with the REMOTE SYSOP connection.

Message-ID: <315E0CFB.7991@cyberenet.net>
Rendered body type: text/plain

While the dicussion of a symbol has been light and entertaining, there
is a REAL need for a symbol for manpack operations of APRS.

With the comming of the MIM module and I'm sure to follow soon will be
other configurations small enough to allow truely portable operation, a
manpack symbol request [I think] is not out of line. Unless I'm mistaken
there is now no such symbol.

My vision of the symbol would be a simple stickman (my favorite is the
old stickman logo of "The Saint" TV series, but something along that
line would be nice as it would not take up much real estate onscreen.

Am I wrong? Do we presently have such a symbol?

I agree, it seems that many aren't paying much attention, even on the alt.satellite.geo.nav usegroup. Most are still under the impression that SA will be shut off this May. But that is only the deadline for the military to submit a reason as to why they shouldn't shut it off. And they've met that deadline saying they need FOUR TO TEN YEARS to implement a plan to set up a system of "selective denial" that military GPS receivers can overcome.

I listened to Gore's press conference on NPR, and they even stated that they have NO system or even a clue as to how they're going to implement selective denial. A RAND spokesman said it may involve jamming or spoofing the GPS signals from space with a more powerful terrestrial signal (not hard to do), but they haven't even begun to figure out how military receivers will overcome this.

BTW, I heard Garmin stock went way up Friday.

Good call, Claude, I'm glad someone else is paying attention, too.

Bob is there any way to add a feature so when using Mapfix18.exe to allow for printing and or saving the Lan/Lon of the upper left box to a file, or at least the current cursor position by hitting a combination of keys. Right now i go trough more paperwork writing down the Lan/Lot from a gridmap then it takes to make the actual series of maps. Would also be great if the files it saves would be incremented starting at #1. I know your upto MAPFIX23, but maybe it could be added to 18 also. By the way i have received a couple of messages saying Mapfix23 with the new command structure is just to involved and hard to use ;-).

```
There has been way to much discussion on this topic. No matter what,
there will never be enough time for the Sprouls and Bob to keep up with
the request for new icons, nor will there ever be enough characters. I
have a new proposal though...

Assign one of the current characters to be a custom icon...and follow it
with two additional characters which give a unique icon 'address'. The
addresses and icons themselves would be administered by a designated
party, When someone wants a custom icon, they submit it to the 'icon
coordinator', who adds it to the official icon file and assigns it the
two character address. When displayed without the custom icon in the icon
file it would show up as a generic icon, but if the icon is present it
shows the custom icon.

To work, we first need to hear from Bob and the Sprouls as to whether
this is possible, whether it is worth their effort, and have them decide
on the appropriate format for exchanging the data.

Yes, this would be a lot of work for them, but if done it would cut the
amount of traffic in this sig in half...think of the savings in man-hours
;-)

Actually, the extra income is not being projected due to loss of SA. The
more significant announcements were that 1. GPS would be free in
perpetuity for end users, and 2. GPS would be freely available to all
areas of the world.

There had be talk of requiring a royalty for every GPS sold to pay for
upkeep of the system, which would have raised prices and slowed sales.
The gov't has also until now reserved the right to turn UP SA or even
turn civilian access completely off over other areas of the world. This
has slowed the acceptance of GPS outside the US. The committment to GPS
support will also stimulate US acceptance of the system. These reasons
are why Garmin's stock went up.

>Bill KE4EER

Dear Mr. Know it all,

Will you please get off your high horse and start reading instead of ranting! I
said many others with Magellans wish they had RMC, I did not say that ALL
MAGELLANS did not, I was saying that many other Magellan users do not have the
RMC statement. I own a Garmin but use 2 Magellans at work and have that problem
myself.

Sorry Bill I stood up for you on a few occasions, then I just sat back and
stayed silent as I noticed you going down hill and took no sides. Your comment
was uncalled for and shows your narrow mindedness, I guess I got to agree with
some of the others as to what you really are. Out of courtesy to my "Elders" I
will refrain from telling you what I am thinking now!

899. How to put it all together?

From: rsellers@misha.net (Roger Sellers)
Date: Sun, 31 Mar 1996 16:15:15 -0600
To: aprssig@tapr.org
Message-ID: <199603312215.QAA04036@misha.net>
Rendered body type: text/plain

This past weekend, I bought a Kantronics HSP cable to utilize with my
ICOM 2000H, KPC-3, and Garmin 45 GPS.

First question:
    the HSP cable has 3 wires, red,black, and shield. The GArmin 45 has 4
wires, red +voltage,black ground, brown serial data out, and white serial
data in. I'm not any good at all at reading schematics. But If I interpret
what I'm seeing, it shows:
 NMEA- going to DB25 pin7 and other end J7 GND
 NEMA+ going to db25 switch/diode(?) to DB25 pin 2 & 4 and other end J3 RxD
     I opened the DB25 that the wires all seemed to go into. I could see the
HSP black and shield apearently going to a connection marked 7, but the red
appeared to go to a connection marked 20.

   So what do the HSP 3 wires connect to?

Second question:
  OK, assume I got the cables correct.

  What text/commands to I input to the KPC-3, Laptop (single DB-9 serial
port), APRS software (DOS/WINDOWS), or Garmin do that I get the APRS system
to not only becon/track my position, but that I could still use the APRS as
normal?

    I was told the HSP cable would allow this. In other words, I want to use
all of it together, all the time. Not just the GPS to beacon my position, or
to use the computer with APRS. All as a single integrated system.

  I haven't found a procedure yet to simply spell this procedure out. I've
been told it can be done. I needed to above to do it. Well, I got the stuff,
now what?

Thanks in advance,

Roger Sellers

900. Failure of KPC-3 (6.0) ?

From: warakois@world.std.com (James A Warakois)
Date: Sun, 31 Mar 1996 19:09:49 -0500
To: aprssig@tapr.org
Message-ID: <199604010009.AA08044@world.std.com>
Rendered body type: text/plain

Thanks to the few enthusiasts who sent me their setup configuration for the
KPC-3 and Garmin-45...I have tried each of them. Though there was very
little difference..I also searched the Readme files again and Scanned back
over 6 months of APRSSig digests..

(I say this for KE4EER's benefit)

I have decided that there is a bug in the firmware in my KPC-3 (early copy of version 6.0)

My question: Can anyone else confirm that there have been bugs in the early KPC-3 (6.0)'s?

I seem to remember some conversation about it. But, for the life of me, I can't find it.

Hi Bruce,
I have a KPC-9612 running the net rom now and it seems to work fine. I haven't set it up for an APRS digi yet, so I haven't checked out all the aliases.

It isn't an expensive upgrade, so give it a try

> up a system of "selective denial" that military GPS receivers can overcome.
>
> I listened to Gore's press conference on NPR, and they even stated that they have NO system or even a clue as to how they're going to implement selective denial. A RAND spokesman said it may involve jamming or spoofing the GPS signals from space with a more powerful terrestrial signal (not hard to do), but they haven't even begun to figure out how military receivers will overcome this.

Color me unsurprised. I read the line item in the DoD appropriation that mandates removal of SA, and found it so wide open as to be a non-contender for rational thought. Or, in other words, typical Congress...

SA "replacements" such as Area of Battle selective jamming and spoofing are being investigated. I've been so told by reliable sources, and seen some evidence of it when looking at PRN health on selected birds when they were pretty much overhead White Sands, and some areas in Arizona. I suspect there's more going on than meets the eye.

This has remained a consideration of DoD since commercial units became widely available. That they cannot stop the flood of non-DoD use makes their job somewhat harder and definately more expensive, especially since now they much accommodate a full set of civilian users on both L1 and L2, rather than simply giving a Caveat Emtor warning.

Their newest, $149 entry did not even have a serial port last time I looked. Or did they add that by popular demand? Magellan has had a grim history with the GPS industry, although they seem to have gotten their act together a bit better with the consumer market. I'll remain skeptical of them until they're willing to sign a statement assuring me they have complied with ICD-GPS-200 completely in the L1 domain.

909. TAPR GPS Purchase (Announcement)

From: Greg Jones <wd5ivd@tapr.org>
Date: Sun, 31 Mar 1996 21:22:02 +4200 (CST)
To: aprssig@tapr.org (APRS SIG), tapr-bb@tapr.org (TAPR-BB mailing)
Message-ID: <199604010322.VAA14495@tapr.org>
Rendered body type: text/plain

```
TAPR offers group GPS purchase                        4/1/96
------------------------------------------------------------

TAPR working with Bob Bruninga, WB4APR, will be making a group purchase on
Garmin 20 GPS units.

For full details on the purchase as well as information regarding the unit,
please see the following web page http://www.tapr.org/gps

The price will be:
   $165.00 US for members of TAPR
       or
   $175.00 US for non-members

This kit will include:
     * Garmin GPS-20 (MultiTrac8 sensor) engine (1.83" x 2.74" x .45")
          The Garmin GPS-20 is similar to the Garmin GPS-45

     * RF pig tail with connector for unit
         (one end is the MCX male connector
            and the other end will be non-connected - see below)

     * power/data cable with connector shell and pins
         (The connector is a subminiature PCB edge connector
          and will need to be built - see below)

     * Documentation

TAPR will be taking orders for 50 units, which is the minimum purchase.
Once 50 units have been purchased TAPR will order the Garmin units.
TAPR will deposit money when the units are ordered from Garmin and ship
when the units arrive from Garmin.  It is expected that the demand will
be high, thus a short period should be required to receive the 50 orders.

Please note:  This is not an enclosed/sealed unit.  It is assumed that
the purchasers will be installing the unit in another enclosure for normal
and experimental operations.

No 10% Discount for TAPR Members.  Due to the nature of the purchase,
the $165 purchase price for TAPR members represents the membership
discount.

If you would like to order one of these units, you can
      e-mail tapr@tapr.org,
      phone (817) 383-0000, or
      fax (817) 566-2544.

      Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time
```

These units will be useful with current APRS software and the upcoming TAC (Totally Accurate Clock) kit that Tom Clark, W3IWI, has begun discussing with TAPR to do as a kit in the future. For more on the TAC project check: ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

Questions concerning the unit and details on the buy will be handled on the TAPR APRS Special Interest Group list. To subscribe,
send e-mail to:
listserv@tapr.org.
In the message type
subscribe aprssig YourFirstName YourLastName.
The server will then send you a message back. Announcements on the status of the shipment will be made to the TAPR APRS SIG and TAPR-BB lists.

Shipping and Handling

- Shipping and Handling within the US will be $7.00 US by UPS Ground unless otherwise requested by purchaser.

- International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

General Information

All Garmin engines come complete with DGPS input capability (see note below), PPS timing output and lithium 3V battery on board.

MultiTrac8: Tracks and uses up to 8 satellites for accurate, reliable GPS data at an incredibly low 1 watt power consumption. Unit has and a real time clock, PPS timing and nonvolatile memory right on the board.

Footprint (1.83" x 2.74" x .45")

Architecture	Patented MultiTrac8
Time to first fix	
reacquisition	< 2 sec
warm	20 sec
cold	2 min
sky search	15 min
update rate	1 sec continuous
Dynamics	
velocity	999 knots
acceleration	3 g
jerk	20 m/s^3
Datums	102 predefined, 1 user defined
Electrical	
input voltage	5.0V DC +- 5% regulated (a suitable regulator should be used)
power consumption	0.8 watts
backup	on board 3V lithium (10 year lifetime)
sensitivity	-166 dBW
Connector	
antenna	50 ohm MCX female connector for active (5V DC @ 15ma) or passive antenna
power/data	single row, right angle 12 pin male
Physical	
configuration	1 integrated board engine
size	1.83"W X 2.75"L X 0.45"H
weight	1.1 oz
op temp	-30 deg C - 80 deg C (remove Li battery for extended usage above 80 deg C)
storage temp	-40 deg C - 85 deg C
Interface	
compatibility	2 RS-232 serial ports
data rate	User selectable baud rate 1200/2400(tx only)/4800/9600
format	NMEA 0183 v.2.0, ASCII
inputs	Initial position, date and time (not required), 2D/3D & earth datum command,

```
                          RTCM-104 v.2.0 differential
     outputs            Position, velocity & time, receiver and
                          satellite stautus, geometry and error estimates
     timing output      Timing output with +- 1 microsecond accuracy

Frequently Asked Questions
--------------------------

* Any altitude limitations?
  The GPS engines will deactivate themselves above 50,000 feet.

* The Garmins only send out final solutions (NMEA sentences).
  There is no other data available from them (including preprocessing data).

* The Multitrak8 has only one channel, but is multiplexed.

* The Multitrak8 can accept DGPS signals (see note below).

* Antenna options (which can be purchased directly from Garmin if required)
  include:
       - mag mount
       - flange mount (bolt to a car)
       - trunk clip
       - suction cup mounted

* The unit has true time clocks, PPS timing, and nonvolatile memory
  on board.

* The interface is NMEA 0183 (TTL levels) and RS232 (+ and - 15 volts)

* The unit can be powered by AA batteries.
  Batteries or external supplies will require a suitable power regulator.

* The unit only gives NMEA sentences as output, no extraction
  of RTCM-104 data.

* There's no problem with the antenna being close to the boards.
  All sensitive components are shielded.

* The unit has a LNAs and you can use passive antennas.
  You need to keep the antenna runs short however.

* The antenna is attached with a MCX connector, which is a friction
  lock connector.  A male MCX connector with short RF cable is included
  in the kit purchase.

* There's a header for connecting the data cables.
  A connector and cable will be included in the kit (it will need
  to be soldered).  The connector is a subminiature PCB edge connector.
  This is not the same connector as used with many hand-held units.

* You cannot adjust the intervals that the boards outputs data.
  However, you can adjust their baud rate.  At 4800 the boards repeat
  data every 2 seconds. At 9600 baud, data is repeated every 1 second.

* The boards do adjust for leap seconds (via the satellites).

* For DGPS, since these are just the boards, you can't use the Garmin DGPS
  receivers.  The Garmin units get tuning instructions from the GPS keyboard

  (which are not on the boards).  To receive DGPS signals, you'll need a
  tunable beacon receiver.  Correction signals are sent in through the
  data in cable (just like the handhelds).

Hi Jim,
I am an amateur dealer, and I don't remember Kantronics informing us of a
problem with v6.0 software. I have one running at this time, and if you like, I
will remotely connect to it and copy my DISP G, so you can see it. I had
another look, and you don't require the last command, RESET. It will restart in
GPS mode as soon as you power it up. Does the TNC every go into transmit? If
so, can you see the packet frames being sent (you will need to watch from
another TNC).

Also, on the Garmin 45, make sure that you have selected NMEA data output (v1.5
is good enough). We have found that if you place the Garmin 45 into test mode,
than it will reset the data output format. Lastly, make sure that the data
output wire from the Garmin 45 is wired to the Receive data line on the DB25
connector (I don't have my manuals handy, but they are clearly marked in the
books).

If you are still having a problem, let me know and we will dig further. You can also watch the data coming from the GPS with a PC and a terminal program.

Hope this helps a bit.

cheers...mike

```
With Field Day approaching, we were wondering as to who else may be running
APRS
for the Field Day weekend ? If so, what freqs will be utilized.

The DuPage Amateur Radio Club will be running APRS on VHF and perhaps HF (if
we can wrestle a rig from the HF guys)

Info can be directed to wb9woz@aol.com

Thanks & 73's
Bruce Tobias

A ham-friend at OSC indicates that they have launched TWO VHF scanning sats and
have two years of worldwide VHF utilization and power density data.  I am
uncertain as to who really owns and operates these satellites.  OSC is now
part of Fairchild Aerospace.

I hope this 'transmit only' rig isn't going to be used in ham radio.

Far as I know on the commercial bands you got to listen also. This is the case
for IB and PS class stations.

I think John (and I) is concerned with the ability to listen to the channel
before transmiting. Not only is this good operaiting practice but it is also
necessary if you follow the FCC rules.

If you take that in mind and also the situation in Broward and Dade Co. where
you have more than several WIDE's in one area and quite a few APRS users this
can become a mess. Granted, if you overlook the FCC rules and also operate from
a less populated APRS area, as where Jerry and I live it could be tolerated but
why start the ball rolling.

Remember, at one time a group wanted to get several of these transmitters for WX
station reporting from some considerable height. Great idea to put commercial
equipment to use but picture 4-5 of these in one area at about 100-170 ft.
transmiting WX reports often without waiting for other packets to clear. Granted
APRS will continue to TX messages till they are RX'ed but this just increases
the turn arround time, and mobile trackers that are only transmiting every 10 or
so minutes could be hurt if their packets are collided with. This was put to
rest a few months ago thank God, let's not encourage it again.

To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960602004021.8826K-100000@arctic>
Rendered body type: text/plain

```
I was surprised at the ROchester Hamfest when someone suggested that the APRS
Mic ENcoder should have a programmable default position.  The whole idea is
mobile position reporting, right?...

Well, his response was that EVERYONE has a MIC, only 1% or less of HAMS have
GPS units.  If the APRS MIC-Encoder becomes a common entity on voice
repeaters, then the fixed stations may as well pop up on the map too, so
you can see who is talking from where...

Seemed like a good idea to me...

14. MacGPS Pro 2.0 release

From: kc5ejk@onramp.net (Robert Winingham)
Date: Sun, 2 Jun 1996 01:02:04 -0500
To: aprssig@tapr.org
Message-ID: <v02130500add6d7337a42@[199.1.11.107]>
Rendered body type: text/plain

```
I just got the new version of MAC-GPS PRO and it is real slick.

        ( The older shareware version is in the TAPR APRSsig area.)
DOS/WIN users may want to check out the Precision Mapping GPS Edition
        FREE Beta 1.0.1 - 5/26/96 (2140K ZIP) -- URL:www.justsoftworks.com
        for a program that can do almost the same.

This is one of those map making programs that can, plot my position on a map
using a connection to a GPS.

If you are using a Garmin GPS and a MAC computer this $30 program
will let you take any screen saved map, say a PICT file from
Street Atlas USA and use it to plot your position. It does a good job
of auto tracking. It also lets you up and download all the information from your
proprietary Garmin GPS data base. The tracks, waypoints and routs are then plotted
on your chosen MAP.

I hope Keith will make the next version of MAC/WIN aprs use the same type of
calibration method when you import PICT / Bit-map images and smoother zoom.
Several of the items in MACGPS are now in Mac APRS and lots of neat items are
on the way, but if you can't wait ......

Two Items in MACGPS Pro I like for car use are the LARGE display of your current
position/speed and the speech option to say this information.

Here is the short version from the upgrade notice.
```

```
-------------------------------------------------------
The long awaited release of MacGPS Pro 2.0 is finally here.

The calibration method for background maps has been completely changed. You no
longer enter the map edges. Instead you click on known points which are used to
calibrate the map.

There is an additional new way to pan and zoom-in on the map. Simply click and
drag the selection rectangle to select the area you want blown up to fill the
full window. Zoom-in is no longer limited to a fraction of the overall map size.
You can zoom in to 1 meter per pixel no matter how big your map is.

Additional Map menu options allow you to use a large current-position marker, to
display the bearing of each leg of the routes shown, and to set the map scale to
a precise value.

A new function showing overhead Satellite Visibility for any time and location
has been added.

The Real-Time window has been re-organized for easier reading in more logical
groupings. Estimated horizontal and altitude errors have been added to the
Real-Time display. There is a new command on the Real-Time menu, "Large Display
of Current Readings". This gives the same information as the original Real-Time
window, but with a larger font for greater visibility at a distance or with a
quick glance.

Larry James          http://www.csn.net/~lwjames
James Associates         lwjames@csn.net
                      303-530-9014 (voice or fax)
             Garmin GPS 45 with Portable Helix Antenna $ 249.95
-------------------------------------------------------------

One final item: Dr. James sent out the software over the internet direct to my
E-mail box. Last week I got two more updates that fixed a few problems. A great
idea as I hate having to look all over the FTP sites trying to find an update.

"Just a happy user"

Using MacAPRS, can the auto track work between maps?  I was wondering if
I was travelling along and went off the edge of a map if it would open
the map with the closest zoom for the area.

Also, downloaded a bunch of DOS maps.  When I place them in the maps
folder they show up outlined.  There are a lot of them and that can be a
little irritating.  I did notice I could put them in a sub-folder (nice
touch).  There is still a problem, no matter where I put them, with
incorrect map boundary and map linking.  If I open the map at least once
the boundaries are displayed correctly, otherwise they are totally
non-sensical.  How can I fix this?

Tnx,

The first thing I do when I get an update of the APRS program is to
remark out the parity line.  It seems to be a foolish thing to have as a
command in the first place.  If the TNC is already communicating with the
computer then the parity is correct to begin with.  If the TNC is not
communicating with the computer then no 'parity' command will get through
at all.

Fix the 'parity' and baud rates etc BEFORE you run APRS using a standard
communications program, and be sure to delete or remark out the 'parity'
line.

In order to make a valid FD contact there MUST be information exchanged!!! I'd
say the simplest way is to do a one-liner to a station as you see them!!!

I'd say just do the one-liner with your FD exchange and leave it at that. When
it gets ACKed and you receive an exchange back THAT'S a valid contact!!!
Monitoring just doesn't count!!!

Everyone watch for KU0G on FD! We'll be running 10.151 LSB (of course), 7085
and wherever else we can find activity!!!
We'll also be up on CW and SSB!!!

Ron,
(Sorry about the lag in my reply - it's hard to keep up with this SIG every day. If you'd like a fast answer from me on something, please also CC: j@harper.com)

I have successfully run the Garmin-45 into both the display and my PC serial port simultaneously. My old Trimble also worked fine as a source in that "Y" configuration. It has been my experience that serial outputs are able to drive at least two serial inputs; I've applied "Y" cables to about a dozen different applications over several years and found them all to work fine. I would not guarantee that any combination of random devices will work under any circumstances, but think the chances good in typical situations. In my applications, I have kept the wires fairly short (about 30 feet was the max I ran) and used relatively low speeds (9600bps), but those should be ok for most aprs/display combo setups.

Three days ago I apologized for this....How many times do you want me to repeat myself??? Geez, talk about wasted bandwidth.....

I noticed you didn't mention Agrello Engineering and the DFJr....Hey! If you're gonna whine, you simply MUST whine equitably!!!!

The Blackjack antenna is of a LIMITED interest and I made it available to the members of the SIG FIRST as they are the people most likely to use it!

Why should it matter to you, George? You DON'T have to read it just because it hit your mailbox! THAT'S what the Delete function is for: From now on, just delete anything that has a subject you don't care to read and leave it alone...

In the mean time, ONCE again with feeling:

I apologize for wasting the bandwidth with my previous posting regarding the shipment of antennas that people on the SIG ordered! I was in a hurry and didn't have all of the EMail addresses handy! I will not do this again...

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator
EMail: ku0g@sprynet.com

PS: George, you're NOT on the reservation list!

You know, I just decided that KD4FJ's posting really made me angry!

To the best of my knowledge, Internet is a forum of free speech and expression. I have the right to advertise my product here, as would anybody else!

While I don't actively pursue such activities, if I wanted to, I would very well be within my rights to do so!

If you don't want to read it, DELETE it!

What I did is NO different than TAPR posting messages about the shipment of the GPS units that people ordered!!! I didn't see a complaint about them in Georges message....

Enough said, I'm off the soapbox, but you can bet that it'll be a cold day in the underworld before I ship an antenna to KD4FJ!!!

A 'transmit only' rig can be used in ham radio, as implied from your statement, but there had better be a receiver nearby to insure that there are no other transmitters using that frequency. It is quite against the FCC rules and regulations to interfere with another station, and the only way you can avoid the interference is to use a receiver as part of the rig.

I agree the it would have been better if the notices had
gone out individually.

(Although it saved Jim a lot of time to type up one quick
msg to the sig and giving him more time to service requests.)

Advertising a product that has direct applicability to the
members of the sig is perfectly OK by me, esp if it is being
made in "cottage industry" fashion. Let's not throw out the
baby with the bath water. The time to gripe is when the notiices become
too frequent.

It is a bit ironic that your complaint about the posting took up more
bandwidth than the post you were complaining about. Sometimes it pays to
just hold off and see if the behavior you object to  recurrs.

```
Steve reports that the Natl WX service has a standard for RAIN-PER-DAY.
(probably starts at midnight???)

APRS goes through a much more complex process of keeping  a sliding
history so that it is reporting rain-per-last-24-hrs continuously.

This I thought was a neat idea, but it is a pain and takes a lot of code.

I would be happy to change APRSdos to a RAIN-PER-DAY, and make it so that
it would keep track even during a re-start, if that is what the WX guys
think is best.

SAME would go for the RAIN-PER-HOUR.  Mine is a continuous sliding
rain-per-last-60 minutes.  It would be much easier to clear the count
on the hour and only accumulate one value.

THe advantage of my way, is that at 16:05, you know how much rain fell
since 15:05.  In the new way, at 16:05 you would only be able to learn
how much rain had fallen since 16:00...  and would have NO RECORD of what
fell since 15:05...

I have fixed the DAVIS and U-2K fading to gray.  will be in 76b soon.

Click on VHF port for access to the dual port tnc...it is a bug.

Using the message facility, sends the message out on both ports whether
you want to or not...you can't control it, and just have to accept that it
is going to happen....until it gets fixed.

Are you running WinAPRS under Win-OS/2? If so what version of Win32s are
you using and where did you find it? I put together a dedicated  Win95
machine for WinAPRS and it works fine, but it would be nice to know I had
a backup available with OS/2 Warp and Merlin to come. 73,

APRSdos REPLY COMMENT: Yes, but you didnt give a clue as to how easyy it
was to convert. I figured it would take complex quadratic or higher
order math to convert every point in a map. She suggests that you only
convert the ORIGIN and its done.

I was hoping you would jump in and tell me the exact formula rather them
me having to pull it out of some program code.

So I was thinking of you specifically when I posted my reply, hi hi

So, do you have the textbook conversion equation?

I doubt that it will happen. The 2m and 70 cm bands are allocated worldwide for Amateur use.
The 420-430 band is also allocated for government RADAR; that's the "Line A" stuff. However,
435-438 MHz is an international satellite allocation.

If anything, they'll probably end up with a small slice of one of the business band
allocations.

> Regarding the use of 14100 Khz, remember that the worldwide propagation beacons are on that frequency. It becomes a matter of how irritating one wants to becomes even though the APRS bursts are short! Cliff W6HDO

APRSdos REPLY COMMENT: EXACTLY. Thats why operating packet LSB will absolutely NOT interfere with them. THey are operating on a carrier freq of 14.100 exactly. If you tune your SSB station to 14.100 LSB and operated an AFSK TNC, then you will not hear them at all, and you will also not interfere with them at all. Your transmitted tones will be either offset 2210 HZ lower and have a bandwidth of about +/- 700 HZ. Therefore all of your energy will be well outside of a CW receiver listening to 14.100.

We proposed that freuqency long ago hoping to take advantage of the fact that many hams dont understand the offsets between their DIAL frequency and their actual emission energy.

By the way, the DIAL frequency to avoid so that you do not interfere with the CW beacons is 14.100 + 2210 hz or 14.102 for LSB and 14.998 for USB. That would definately be a no-no. hi hi

Message-ID: <Pine.SUN.3.91.960602140828.13915C-100000@arctic>
Rendered body type: text/plain

Remember months ago when I bought a number of $120 MFJ 8621 Data radios. They work, but they did not appear to give me the performance that I had been used to with my $1200 VHF all mode rig... (hi hi)

TOday, I finally put one on the bench and measured about 2.5 microvolts to get good quality S/N ratio. This is about 10 dB worse than their spec and also my big rig. So, I thought I would go inside and tweak it up...

Nope, only two adjustments. XTAL freq and Discreminator coil.

The RF front end is just two coils of loose wire that you squeeze or expand with a toothpick. They were right-on. I could only make them worse. The whole receiver is just a single transistor RF amp driving an IC chip.

So, at 33% of the usual cost of a 2m radio, they seem to be perfect for dedicated use where all you need to do is hit the nearest node or digi. Also remember they do have the davantage of being 9600 baud data ready (that is what they were designed to do, ayway). So, I am not dissatisfied, but now I know under what circumstances to use them.

On transmit, setting the transmit audio level LOW is absolutely essential. I actually like that, since 98% of the packet signals that you normally hear are quite distorted since most people do not adjust the XMT audio level low enough not to cause clipping in their MIC circuits. THe MFJ has no MIC clippers or limiters, and if the audio is too high, you simply deviate out of the passband, and no one copies you.

This is the first I heard of these radios... so I did a little looking through the mountain of Dayton literature, and there it was in glorious black and white.

Also, I found that there is an APRS specific version out there.

>From AES (www.aesham.com):

MFJ 8621	MFJ VHF DATA RADIO/145.01 MHZ	119.950	109.950
MFJ 8621X1	MFJ APRS READY VHF DATA/145.79	139.950	129.950

Wish I had known about these; probably would have picked one up at Dayton. I could really use one for Field Day...

43. APRS Users in FL Space Coast Area!!

From: n2czf@gate.net
Date: Sun, 2 Jun 1996 16:08:21 -0400
To: aprssig@tapr.org
Cc: hoebakeb@irwin.vetrol.com
Message-ID: <199606022008.QAA17046@osceola.gate.net>
Rendered body type: text/plain

I would like to inform any "dormant" APRS users in the Space Coast area to keep an eye out on 145.79 in about 1-2 weeks. Many have asked for a WIDE digi in the Melbourne Daytona Beach area and I think we may have succeeded. This will be a test digi for the time being at 400ft runing 30 watts just North of Melbourne.

We hope that this digi will give the Daytona and Melbourne area a opportunity to link to Orlando all the time and also give us a possible link to Daytona from the Southern part of the state if we can get a WIDE in range of the Space Coast Digi.

The reason this is a test digi is due to the unknown ammount of users that are in range that will use it. If the digi is of no benifit the digi will not remain at the site. If of course the digi is of benifit to others and seen as worthwhile I have been told that it can be there for good. We have had users in the area over the years that come and go due to the lack of activity, if everyone just gave it a chance they will have noticed that there IS ACTIVITY it is just that no one stays on long enough to get the group going. 2-3 get on and then leave do since there are no more users, a few months later one or 2 pop up and leave since there is no one there and so on and so on.

I do not know what else the WIDE digi sysop wants to release as far as information and the expected time of the "trial" but try to get on and get as many friends on as much as possible. Make use of it and talk about it on the repeaters so that others may come and see what it is like. This is a golden opportunity and I am not sure how many others like this we can get in the future. So let's try to make it work this time.

I do not even know if the sysop want's to be known at this time so I will leave it up to him to take care of this but I thank him for making this effort. I have explained to him how to get on the sig and I hope to see him on soon.

I agree if it is a Cottage Insustry and the member is a ACTIVE APRS user and sig member to give the person the courtesy of the posting. We have several people on the sig that do make some money (or try to) with their APRS interest as in PacComm, "Mr. Bob", Agrelio Eng., The Sproul Brothers., and some others from time to time. I have never seen a sig have so many "key people" acive and willing to ask questions and solve problems as here.

To make use of a old saying "Don't look a gift horse in the mouth" or whatever.

They spend their time on the sig helping us now it is time for us to "help" them
if you call leting them post a message that can benifit us "helping them".

Maybe personal replies are more in order but if this cannot be done for some
reason I hope the "vendor" would make some sort of attempt to contact me. If
this means a general posting so be it, it may not pertain to me this time but it
may the next!

Watch out for what you wish, it may come back to haunt you!

Hello all,
We plan to operate a APRS VHF/HF Field Day station here in the
Ft Lauderdale Florida area. Our call for FD will be N4HHP.

In reviewing the APRSSIG posting, a few point need to be addressed.

1. Frequency of operations.
   The APRS frequency of 10.151 is invalid as per ARRL FD rules.

(From the ARRL WWW Page on FD rules)
(2) Object:
        "To work as many stations as possible on any or all
         amateur bands (except 10, 18 AND 24-MHz bands) and,
         in doing so...."

Our current plan is to operate on 14.105 during the day
and on 40m night. I also plan to move my HF APRS station
(KT4FI-3) to 14.105 this week to "test the waters".

2. Contest Exchange... (ARRL WWW FD Page)
(6) Exchange:
        Stations in any ARRL/RAC Section will exchange their
        Field Day operating class and ARRL/RAC Section. For
        example, if your club group was planning to operate
        in the three-transmitter, Class A category from Missouri,
        you would send "3 A Missouri". Foreign stations send
        RS(T) and QTH.

3. Rule 7C "...The repeater provision" (ARRL WWW FD Page)
8) Packet Radio:
        100 points can be earned by completing at least one
        QSO on packet radio during the Field Day period.
        The repeater provision of Rule 7C is waived for packet
        radio QSOs. A packet station (one) does not count
        as an additional transmitter. On the summary sheet,

show packet radio QSOs as a separate "band".

The concept of a "GATE" is in the gray area. We interpret this rule to allow GATES as "repeaters". This opens the FD activity to many more of our APRS operators.

There is an issue we must address, we could bog the HF network down to a halt. Might I suggest...

1. FD GATES be renamed to "FDxx", where xx is the band of operation. Example, 20m GATE would become FD20.
2. Position reports kept to a minimum. Example 60 minutes.
3. No mobile tracking.
4. FD traffic limited to FD exchange.
5. If you are on the air, the station is manned.
6. If you are running a FD GATE, manage the GATE.

These are only suggestions, and we need to formulate a plan to have a successful FD operations.

Please comment.

In closing, we are working with the Ft. Lauderdale area ARES/RACES folks. Our objective is to demonstrate APRS as a tool in the their operations. Not all Amateurs understand APRS and some feel that it is a fancy toy. We hope and plan to change that.

If any folks can not access ARRL web page and do not have access to QST, please ask and I can format the pages into text and post them here on the SIG.

Thank you for your time.

To: aprssig@tapr.org
Message-ID: <31B21706.6178@ix.netcom.com>
Rendered body type: text/plain

Are there any DFjr owners on the Sig?. my question is that i recived a warning from a DFjr owner that it will not talk to a computer to well (Or not at all). Now this has nothing to do with it not working with APRS at the present because i'm aware of that. The warning stated the DFjr doesn't have the correct RS232 levels of +12v to -12v, but rather 0 to5v. I know Joe doesn't like this type of message to be posted here, but i must know this type of info. I think Agrelo needs to put out some more information of this type, (If this is true!).

Jim,
i still have the antenna with the 12' cable -- unpaid!
i would offer two solutions (you and paul can figure out who gets the antenna or money):
1. i'll send it to you (default solution in 10 days or so...)
2. you figure out a good way for me to 'waterproof' it so i can put on TOP of the roof of my motorhome and i'll send the check ($40 per the invoice).

as far as the 'waterproofing' goes, i'll accept any way that won't degrade the performance of the antenna and won't prevent it from spending months at a time on the roof and won't prevent it staying on the roof in bad headwinds at 70 MPH... that means if duct-taping it into a 'package' will work technically it's OK by me...... (note i never mentioned estheticly pleasing as a requirement).

Bob, I also had great problems with the MFJ Radio. I put the Data Radio
```

```
on my bench and measured 3.7 uv for 20 dB SINAD, way worse than
specs.(.25 uv). So I contacted MFJ and they ask me to send the unit to
them with a detailed note. A few weeks passed and I called, they in turn
had sent the unit to an outside engineer(they could not test the unit in
house, no test equipment!!!!???) Anyway I got the radio back with a
note from the engineer, said that the antenna switch(diode) was below
specs(leaky from bias). He replaced the diode with another one at
different specs and said unit should meet specs. I put the unit back on
the bench; rcvr sens .35 uv. Checked it against one other service
monitor(same). Also the transmitter has alot of trash(Spurs), retuned
xmiter and add a harmonic filter. MFJ said if I had any other units
below specs to send them back. I just replaced the PIN diodes on my
other units. Hope this helps.

Looks like that area is getting ready for the next "Big One". They are
getting prepared, Good deal!

You may be seeing the digis as their unproto paths may extend into your
area. The users may have their paths set to just one wide. You can only
see what the other group wants you to see if they are not direct.

I was not a Dayton, but both from what I've heard hear on the sig, and my
own experience, the APRS version is hard to come by .. You place your
order, and then you WAIT, and WAIT, and WAIT, for it to be delivered.

Anyone else have a clue?

de wb4apr@amsat.org

---------- Forwarded message ----------
From: Randy Hall <randyh@gvgadg.gvg.tek.com>
To: bruninga@nadn.navy.mil

The first letter of some callsigns, mine included, are changing to
something that looks like a H. The H is about two characters tall and a bit
narrow.  ???

Running 76 with a PICO TNC.

Any ideas?
```

Actually, the conversion is *not* as easy as indicated previously.  When we do
it on OUR maps it requires a significant amount of code crunching.

I'll be doing that all day tomorrow.  While I'm waiting for the dual-Pentium
120's to crunch the problems, I'll do some tectbook research.

APRSdos REPLY COMMENT:  Thats no different than MOST GPS's which also
only have 0 and +5.  Its nothing to panic about.  Can be solved with just
a resistor to -v if it is a probem for your particular PC.

>       radio QSOs. A packet station (one) does not count

APRSdos REPLY COMMENT: Does the OBJECTIVE to work stations on the other
bands translate to a PROHIBITION or DISAUALIFICATION if activity is
conduceted on 30m?  In either case, the DIGI provision clearly makes
GATING legal for FD.  The INTENT of the other bands rule is to NOT
QRM these narrow bands by having contesters all over the band.  BUT APRS
FD activity would only be on the one channel anyway, so the spirit of
the rule to limit interference to other users of the band is CLEARLY
met to the fullest extent on 10.151.

Can someone get a ruling on this?

1.  I got the little $50. Trimble Active GPS ant. sold by Pac Comm up and
running with my trusty Magellan Trailblazer ths weekend.  Works great, locks
on in a fraction of the time of the Magellan OEM ant.  Built-in mag mount on
bottom.  Good buy if you can overcome the SMB connector.  Does anyone know if
the enclosure is waterproof, water resistant or what?

2.  Expect to have one or more APRS stations up in Jacksonville for Field
Day.  I have not resolved the digi problem to get out of Florida so I may
just be watch myself.  Is there a particular symbol to use for a Field Day
site?

Wake Up Bob!  this is a gray area. Do you really want to trash the APRS
use of the frequency every year? It works today for unconnected use. Now
you want to add connected message handling as well for contesters?

> Can someone get a ruling on this?

You should know the answer ... who cares if it is legal, the load on a
single HF freq would be tremendous as every FD packet station would use your
loophole for a couple points. Nothing says they have to be running APRS.

The folks out on the highways and coastal waters that are using HF APRS will
just have to wait it out.

A friend here in South Florida bought one of the MFJ radios thinking it
would be a cheap alternative to getting into 9600 here. We tried it at
1200 first (needs tuning inside to switch to 1200) and had poor success.
He was able to copy a strong station on 145.01 pretty well but was also
copying stations on 145.05 as well.

Actually, when you think of it, that makes it a pretty useful multi
channel monitor, hi. Naa.

This is no big deal and is done a lot now days.

I think the orginal RS-232 spec was +15 and -15 but most computer
work with the 0 to 5v . Remember that some of the handheld GPS
units output 0 to +4 volts and this has worked for all TNC's and
most use this same GPS output voltage to work with their computers.

Rendered body type: text/plain

Received the Trimble antenna from Paccom two weeks ago. Replaced the connector with RG-174 conventional (not crimp) BNC ($3.50). Works great with Garmin 45.

For the past two weeks, have been using the combination above to gather trail data for equestrian trails in my local area. The antenna is placed inside a regular baseball cap with the lead running down the rear seam held in place by a couple of wire ties (the antenna literally rest on top of my head when wearing the cap). The Garmin 45 is carried in the breast pocket of a safety vest. The Garmin has maintained a good steady lock through the heavily wooded areas traveled. It was really neat seeing the track of the southern coastline of the Rocky Gorge Resevoir when I printed out the data.

Thanks for the posting Bob, but that wasn't the case with my Magellan
NAV5000DX, so don't be to hasty in saying this has worked with ALL TNC's
because my Magellan never did work on a KPC3 even after many suggestions
from people on the sig and also many calls to Kantronics and Magellan. I
finally had to switch to another make of TNC and it worked just fine. By
the way we also hooked the Magellan to a friends KPC3 that normally runs
a Magellan Meridian and it wouldn't work on his either!. Also on the same
note i have not been able to get my NAV5000DX to work on Paccomm's single
port switch even after their suggested fix by placing a resister in the
TNC. So this tells me there's something about my GPS receiver that's
different then most GPS receivers used like the Garmin's etc.

Hmm-  I bought 3 Motorola Mitreks for 25.00 each  at Dayton and 5 old GE
MVPs for 100.00 at Shelby.

One of the Mitreks is now the N4NEQ-2 Digi (after 20.00 worth of crystals)
One MVP is now the N4NEQ-3 Digi  (V e r  y   WIDE)    (after 20.00 worth of
crystals)
One MVP is working as my APRS station at home
One MVP is crystaled up as a spare
My GE Century II   (20.00 at Dayton last year) is in the tracker  at 35 watts

All this plus the extra radios left over for just about the cost of a
drift-o-matic MFJ data radio with the APRS option.

Folks,  investigate the commercial market.  There are *many* radios out
there that are very suitable and much more reliale than the Ham gear available.

> the highways and coastal waters that are using HF APRS will (suffer..)

APRSdos REPLY COMMENT: I certainly would not invite anything other than APRS packets on 10151. Connections, never. I was merely asking if APRS contacts on 10151 could be counted. APRS was designed as a quick response tactical comm system. I thought FD was a good demo of its potential... Direct HF activity on 40 and 20 would certainly be preferred.

Maybe my antenna and I are not aware of all that is going on... What we need is a central LOG of all special APRS activity posted once a week here on the SIG, so that everyone has one reference source for activity.

Is there anyone that would like to volunteer to maintain this APRS ACTIVITY LIST? That station would accept all inputs and post on the SIG here once a week, a list of all known APRS HF mobile stations and their expected frequencies and general area of operation. Also, major special events would be listed. I would suggest the following format:

STATION	FREQ	START DATE	END DATE	COMMENTS
W7LUS-14	10151	continuous	continuous	18 Wheeler all over USA
KD9PJ	10151	?	?	Carribean
AD4MR	10151	?	?	West Coast Mexico
Field Day	?	22 June	23 June	nationwide

Anyone anticipating travel could submit his info to the APRS ACTIVITY LIST keeper. THis way, we would have ONE resource for info, instead of everyone having to DIG it out of the noise here on the SIG...

It should not become an EGO list, but a serious list of stations depending on APRS for serious comm support.

Who can do this service for us?

Well it is next week and I can report that APRS is alive and well in the Newport R.I. area. BUT it could use some help.

First I was located in Portsmouth R.I. (the other end of the island that Newprot is on) using a notebook computer and an HT @ 5 watts (I have a power budget). I have an antenna on the back rail and another on the mast head.

On Sat night I hooked things up and I could hear lots of people. I was seeing 4 stations on Cape Cod, most of the regular Boston area stations (even my home station) all of CT (including Jay - KD1LY), and Long Island. Oh yea there was one R.I. station (KA1RCI) as I expected. I was hearing 4 stations direct - two all of the time and two more once in a while. I could hear KA1RCI and WQ1O-3 all the time. WQ1O-3 is located at Woods Hole Ma. and I have never seen that station from home. It looks like he has an empty unproto path. In addition I could hear WA1LOU and W1GTT-15 on and off.

After I had things hooked up for a while I got mail from N1MIE-2 who I chatted with for a while. At 5 watts I was finding that I was having my packets repeated only about 10% of the time. I also figured that I was just about making it into several stations because everytime I tried anything other than relay as the first hop things got worse. Then I hooked up a 30 watt amp that I had with me and the repeat rate went up to about 30%. Not great but enough to be heard (the boat was on my map at home when I got there).

On Sunday morning there was a little more noise and was no longer hearing anyone while using the masthead antenna. I listened to the audio for a while and there really were not any packets there.

All of this was the masthead antenna (48' up). I could not hear anything using the antenna on the rail. I tried that before using the masthead antenna which is for getting into repeaters back home.

RESULTS:
I think it would only take on reasonable station in Southern R.I. to really time things together in that area for marine mobile stations. Until then if you have a good high antenna you will be able to see activity with lots of missed and lost packets. So APRS is alive in Newport but does need so help. Now does anyone know a HAM in that area that can help get some more stations on the air in that area ??

Bill

RS-232 voltage levels are equal to or greater than +/- 3V. That is, there's a 6V "dead-band" centered about 0V. In that region, the output can be considered "don't know". The RX data load is somewhere around 3K Ohms. So, if your TX data line can supply enough current to pull a 3K resistor to 3V or more above ground, it will be considered a "1". The 1488/1489 line receivers and drivers MAY work with ground (0V) as a logical 0 and anything above 1 silicon Vbe (0.65V), but can't be guaranteed. If you want the line receiver to work ALL the time, try to stick to at least +/-3V and stay out of the dead-band.

```

>the hour and only accumulate one value.

I will be meeting with people from the National Weather Service this week.
They have a specific way of reporting rain, which I believe is for the 24
hour period ending at either 6 or 7 a.m. each day. I will ask them for the
"proper" definition and get back to you.

>From my way of thinking, daily rain reporting should explicitly follow the
NWS standard, and additionally, APRS should report rain in last hour, much
like it does now. I am just sure that NWS does NOT use midnight, but will
get back to you to confirm. I will also ask if they use a sliding 60
minute scale or if they use the last on the hour 60 minute period.

They just called me (NWS). Here is their "official" reporting standard:

1. For 24 hour period precip is reported at 1200 UTC...no change for
daylight
   or standard, so the reporting period fluctuates 6:00 a.m winter, 7:00
a.m.
   summer (DST) here in Iowa.

2. For 60 minutes, it is ON THE HOUR.....no sliding. Hope this helps.

As a side note, I will be installing WinAPRS at the NWS site this
Thursday. (They have 3 hams working there now.)

When someone uploads files, they should upload a text file with the same
filename but with a .txt extension explaining what it contains and how to
extract it. Days become weeks and one forgets what is in it. Then, the
"keeper of the runes" erases the file.

Does anyone know if the file - camaps06.zip has any special instructions?
And could that person upload a description text file to FTP TAPR?

When I measured my MFJ, I discovered 9 uv sensitivity. When I called MFJ
service, I learned that they were well aware of the sensitivity problems and
have a mod to drastically improve it. The mod will be done at no charge if

the radio is within the factory warranty. I sent mine in and it came back Friday. No chance to test it yet but a quick visual inspection didn't show any major change. The repair paper work indicated that they had swapped PC boards and this is confirmed by the Rev 1 indication on the PCB.

Hi Bill and group,

I just went to the bench and tested one for myself to see if there is a problem.

This is not true, the DFjr works fine on all computers we tested, including laptops. The DFjr uses a MAX232 chip and the levels are -12 to +12v.

However, I would be most interested to know what other are finding as well.

Thanks

Clearly designed for reporting systems where the sampling interval is
much longer than APRS users are accustomed to!

So if the APRS format remains with a single figure, the useful thing
to do is to report the previous period's data until the end of the
current period, not to report the accumulator value during the current
period.  This way the WX watchers have several chances to capture the
data off the air before it is replaced with fresh data.
```

```
It would be nice to see both figures reported; the previous period
and the current period accumulator.  Makes effective use of the higher
sampling rate available via APRS.

There may be more to the story than just weather proof. I have not opened up
my $50 ever so small Trimble antenna, but from playing with it it looks and
behaves like a loaded patch antenna. In fact, I noticed that its apparent
gain drops off substantially when not on the roof of my car. This leads to
the (un-documented) conlusion that the metal sheet below the antennas magnet
is needed to form the bottom half of the patch.
```

In other words, beware that it may not work well at all if used on surfaces other than metal surfaces, ie: fiberglass. I would be interested in hearing from anyone who has opened one up to confirm or deny this statement!

> Now in South Florida, "where everyone is a wide" ;)

Yep, and we played with the adjustments to make it "legal" after we changed the xtals. It WAS possible to alter the filtering via the slug tuned inductors to get it within legal spec. We measured about .5uV sensitivity for the two radios we've got. We also see a pretty large distortion on the received waveform.

The radios DO key up within spec, like 1 to 2ms! They must certainly be the quickest radios in town that way....we're looking at some possible mods to correct the sensitivity problems and waveform distortion. If these turn out to be useful, we'll publish em.

Partially good Steve. Two reasons why it should be separate are:

- 1 -
User has to know "...
>There is a README in the file that basically says....use
>pkunzip -d to unpack."

(readme in the zip file that says how to unzip?)

-2-
Multi-platform machines can't unzip the file ... first. They have to be able to visually tell what is in the file. Try to put two files on the upload area. Example for DOS/WIN files: (One with filename.xxx and one with filename.txt)   The WWW format in the near future will *require* a description along side of the file name. The WWW user will read the description and click on the filename.xxx Please help the TAPR guys out by providing this information now so the transition to the HTML format will be

```
smooth. This is true of any platform.

>There is a README in the file that basically says....use

> there that are very suitable and much more reliale than the Ham gear available.

However, there are problems in the conversion of some of these radios; mainly,
the expense (in time or $$) of obtaining the manual for them.

We picked up 18 "partial" UHF MAXAR-80s at Dayton for $4/each.  "Partial" because
they were designed to be used as data radios; the components for the audio section
was never installed.  (We also picked up a couple of "real" MAXAR-80s, as well.)
We suspect that these things already have the wider IF filters for 9600+ installed.

Now, the problem of obtaining the manual, and doing the realignment.

If anyone has suggestions on how to go about this project, please mail me.

Thanks.
```

Interesting.  I normally have mine on my S-10 pickup truck roof.  I recently
moved it to a friend's Suburban and the signal levels seemed a lot higher.
I usually have a couple of sats maxed out, but on the surburban, all
seen sats were maxed out.  So, there might be something to your un-documented
research.

>-Ralph kd1sm

I'm confused...APRS doesn't use a single figure, and I didn't think the
discussion was of dropping one or the other, but rather how to properly
DEFINE the periods of interest.

e.g. Rain and Precip are reported in APRS. Rain is in the last hour,
precip in the last day. All that needs to happen is to define the day as
beginning and ending at 1200 utc, for the latter and using a cardinal hour
for the  rain instead of a sliding 60 minute period. This seems to meet
both  criteria: ease of programming and agreement with NWS.

 If that really is the question, then I would
like APRS to stick to NWS definitions, so we can compare what is reported

by the NWS to our own experience. 73,

Howdy All!

 I've had my Trimble GPS antenna on the roof of my 1993 Ford
Explorer for exactly one year now since I've bought it from Paccom with my
Tiny-2/GPS unit. Been through all sorts of New England Weather, works fine!

FD and APRS: I brought APRS to our field day operation as a demonstration
for the group last year and it was quite a hit! We were visited by the
local Fire and Police officials and they liked it too! We didn't take FD
contact points from it, since it was 30m and 2m. Also, the 20m Phone and CW
operations are not likely to like the desense they get from a 20m APRS
setup, and they are much more likely to make more contacts.

 I say, everybody bring APRS to your Field Day operation, demonstrate it
to everyone, but don't use it for contact points, there are more efficient
methods of that. If you're going to use APRS in an emergency operation,
you aren't going to make one line messages the primary use. You are going to
observe distant weather, track mobile units and storms, DF a station, play
chess!
You're not going to use it as your primary text transmission means.

 Have fun, make FD an international APRS Activity weekend on bands not
involved in FD points.

Absolutely - if we want to imagine that our data will have utility to
services outside our own we should stick to standard formats where
possible. Especially when it's straightforward to do so.

The only one-way that is valid for points is copying the fd bulletin.
     Getting an "ACK" back from a connected station that includes the FD
     info in the connect text is right on the edge ethically, as far as I'm
     concerned.  But, if you spend FD in places (like I do) where there's
     no packet, then talking to ANYTHING counts...%^)

Perhaps a more general filtering ability would be useful.  If one could
set the filter to only display station types selected in a window, that
would be nice.  Another example of a use would be during a special event
where you might only want the stations active in the event (hence the
filter) vice the usually array of clutter.

Just an idea...

Yes. It is not for everyone.
But if everyone sticks to pretty straightforward radios, the tune up
instructions are available readily.
There is a web page with tune up and conversion instructions of Mitreks and
MVPs to the 440 ham band.  I'll bet someone could modify that stuff to
depict the 2 meter instructions as well.

The radios I mentioned come right up on 2 meters with good sensitivity with
just a crystal change (just don't use bomar or Jan crystals).  There is no
```

```
"conversion" per se.

You were going to use them for 9600 then?  or for 1200 APRS?
Too bad the manuals weren't available.

One of the Mitreks, I took to Motorola for tuning because I did not have the
time to do it myself.  They charged 60.00 to do it (a good price,
considering what my time is worth)  I bargained them down to 30.00.

>If anyone has suggestions on how to go about this project, please mail me.

Sorry, my Moto experience is with Mitreks and close kin only.  Good luck. I
have heard horror stories on the Maxars.

That's good to know; I have a Motorola "Mobile Repeater" that I want to get
running.  Haven't had any luck finding manuals, though.

>> We picked up 18 "partial" UHF MAXAR-80s at Dayton for $4/each.

We're trying to get some activity going on 440 at 9600.  APRS will come
later...  I already have an old RCA rig (several, in fact) that is likely
to become a WIDE for the area.  (On the map at Dayton, I saw that
Pittsburgh was in the middle of a blank spot...)

Rendered body type: text/plain

```
For all interested:

Parts ID number = 1-708-538-0021
these folks can tell you what you have from a part number, usually get
the part number from your description, or can tell you what manual you need
from the radio's part number.

Parts ordering = 1-800-422-4210
these folks will take your order.  They can only work from a valid part
number.

About manuals,
Most are still in stock, some are not and will not be restocked.  Prices
can vary all over the place and are not always reasonable.  Usually,
manuals which have been reproduced after the original printing was
exhausted are more expensive.

Hello
I wonder if anyone could help me . I have tried to install and run
APRS in my computer and all I get is APRS in large letters and a
bunch of gibberish , Then the computer starts beeping and locks up .
I am using a NEC 7022 (pentium 75) with windows95 as the OS.
I have installed the same zipped programs at work on the 486 66 and
it works just fine . I also waited until I received the CD from TAPR
to see if that program would work but I had the same results . I have
tried all the versions of the program I could get my hands on without
any joy .  This is the first program that I have had this problem on
so I have to wonder what it is .
Thanks in advance  Doug Campbell VE3DGC

I got a little trigger happy and deleted the message that
talked about the two conventions on how rain fall was
being reported by APRS and the convention.
```

If someone save that can you please forward it to me directly
at miaminet@mcimail.com

I would like to send it to the National Hurricane Center
in Miami for their review.

The APRS Station at the Hurricane Center was receiving Wx Data
from the Keys this past weekend which was reporting rain fall
at a level higher than other recording equipment. It might be
interesting to see which of the two was accurate or if it
was in the way the information was being sent?

We just commissioned a new DIGI in South Florida that is equipped with the
Ultima 2000 Wx Station. I noticed from time to time during the testing that we
were getting a message in the upper right corner of the screen "Com Port
Overload"

Any hints as to what would be causing this?

Hi Everyone,

This may be slightly off topic but it definately deals with a VHF "weak
signal". I recently bought a PK-12 TNC and in the docs there is some
mention of settings for meteor scatter packet. Does anyone here
participate in this or know anything about it.

I never saw the original posting but please Ralph or anyone else fill me in!!

I think a real hot topic could be what can be converted to 902 MHz from the
commercial band. Most anyone can find radios that can be converted for 2M and
440 but how about 902 or 1.2 ?? I hear some of the Standard 800 MHz radios have
been made to go to 1.2 GHZ! Talk about easy pickings for a National APRS
frequency.

Does anyone know of a newsgroup or a sig comprised of hams in the 2-way
radio/broadcast industry ? Seems that there are enough of us out here.

I have a Motorola "Oncore" PVT-6 GPS receiver.

After having the unit glitched, I was finally able to get the unit back to
NMEA mode, from the Motorola Binary mode.

Unfortunately, the unit now inserts a binary character in front of each NMEA
sentance.  This even is present in the Motorola "Binary" mode, as the
Motorola program that I have ("GPS90") also reports "bad data" when it is
being used.

Is there a command/method to "reset/default" the unit?

And since it is obviously a one timer, I don't think we should waste even
more bandwidth (like I am now), nit picking. Geez, some of these lists,
remind me of a bunch of old farts (and I am fast becoming one), sitting
around just looking for something to gripe about, criticize or find fault
with. Do hams have so little productive to do that they just must wait for
that ONE BIG  chance to find fault. LIghten up. Use your delete key. This
is NOT a moderated list and while each person is free to voice his/her
opinion...really is this the kind of thing you really want to spend your
time doing? Please note the irony in my comments, before flaming, if you
would. 73,

The local NWS told me yesterday that DAILY rainfall is to be reported at a
cutoff of 12:00 UTC, no correction for daylight savings time. They also
said hourly rainfall is ON THE HOUR and not a sliding 60 minute period.

They do report other intervals like 3 hr and 6 hr as well, but that has no
real applicability to APRS. 73,

  You didn't mention whether you were working with the DOS or Windows
version of APRS software. On my Desktop Pentium, for some reason I'm having
a similar problem with the DOS version. I've all but entirely given up
running DOS APRS on my pentium. I have no logic or explaination for it. Mine
locks the entire PC at the point the screen says INITIALIZING TNC. The only
way to recover is shut the PC off.
  But I have no problem with the Windows version on my Pentium. Both
versions run fine on both laptops (a 286 and 486 model).

While I absolutely agree with that, I find quite stupid to drop the actual
"rain" format (moving sum over the last hour, or last day) which actually
means something when you look at a wx report. Maybe there's a way to keep
both formats?
Speaking about standards: is everything else in APRS in standard units? I
would like to have the ability to display km, degrees centigrade, Pascals
(or hecto Pascals, this is for pressure)... I am not advocating to drop
usual US units, but just an option so the user have some choice.

Hi Rich,

Sounds great!!! It should be within the range of kc4vbz-10, here in Orlando
which is up and running well/
We have better than 75% success with N7GZT-10 in Lakeland, and on to Tampa.

I don't know if it is conditions, systems or what, but since the Orlando
Digi has go up, we don't see you all to the south. Is WA4JAF-3 still
operational???

I am going to go back to a direct shot at him for a day or two to see if our
digi lacks to the south or if the path down that way has just gotten worse.

I have talked to Phill, in Lakeland (N7GZT) and he had told me that he had
plans for a digi in Melbourne and also on a bldg. at the CAPE. That may be
who you are referring to.

Will watch (with bated breath) for the Melbourne digi!!!

I know that Trimble has a software package that is used to predict PDOPs,
satellite visibility and such before going out to do a survey.  Does
anyone know of such s/w being in the PD or shareware domain?  I would nice
to know things like satellite geometry and visibility before going out on
a data gathering mission.

```

APRSTrak has the capability to take GPS Sat Keplerian's and show the position of the sat's. Any satellite track program will work; I use STSPlus myself. As for PDOPs I don't have and answer. GPS satellite kep's can be found on the amsat website

MacAPRS stays only on same map. You can load a larger map area
(I use the 3 Meg Dallas Maps from the CD-rom) then zoom to the street
level I want and let scroll use that .

I would guess WinAPRS is the same.

Two things to try.

1. MACaprs uses a single key stroke to jump up to the next bigger area
   map. Then you can click to jump down to the correct smaller map.

2. I had to admit to Keith that I had used Macaprs for over one year
   before I remembered I could have more than one map windows open at the
   same time and all showing different maps.

   Try using several map windows open at the same time that cover the route.
   Then close the old one as you leave the area. Have one map open that
   includes the whole path and use the map border function so you will
   know the name of the next map to use.

3. You can save a map to disk with the zoom level and added labels.

The several maps at one time is great to give extra zoom coverage to
a smaller area and still see the big picture.

---------
Auto scroll ideas
  A. Keep my location at center of screen
  B. scroll only when I move off the map
  C. Follow me (and only me) from map to map

I give up.  Here is what I have learned so far:

> N0AN reports that the "official" rain reporting standard is:
> 1. For 24 hour period precip is reported at 1200 UTC...no change for
> daylight or standard, so the reporting period fluctuates 6:00 a.m
> winter, 7:00 > a.m. summer (DST) here in Iowa.
> 2. For 60 minutes, it is ON THE HOUR.....no sliding. Hope this helps.

APRS users like it on the sliding scale teh way I have done it.

THe NWS at Monterey calif say there are only two reports:
1) one per day (taken every 6 hours) but zeroed every day at 0000 UTC
   called the synoptic measurement
2) One per "proper day" zeroed every night at midnight LOCAL TIME.
*  He knows of NO mechanism for taking readings at 1200 UTC.

In Calif, they take spotter reports based on 1600 LOCAL (0000 z) so that
everyone can dump their rain gages before going home from work.

It appears that In IOWA, they must do it a 6 r 7 am (1200 z) before
everyone goes to work....

It appears that these spotter times match the synoptic 6 hour periods,
but are zeroed more for human convenience (who have to reset the gages)
than for getting in sync with other time zones...

He recommends to use the "proper day" zeroed at midnight local time
for the best local use value.

Although I would prefer to adopt one standard, and remove my sliding
scale, I can go either way, but you SKYWARN guys must determine what
is RIGHT for your area apparently it is a local NWS option????

I suppose I could make it a local OPTION in APRS too...

For N0AN, could you confirm from your NWS source what this 1200 z value is?

144. Garmin 45 problem?

From: Richard Amirault <amirault@laraby.tiac.net>
Date: Tue, 4 Jun 1996 18:07:55 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.BSF.3.91.960604175834.2021A-100000@laraby.tiac.net>
Rendered body type: text/plain

```
I seem to be having a problem with my Garmin 45 that I don't remember
being mentioned here on the sig.

I had suspected it before, but after this past weekend I'm sure.

If my 45 looses 'lock' it seems to be unable to re-aquire 'lock' without
POWERING DOWN, THEN POWERING UP.  This, of course, requires operator
attention (to notice the problem) and operator action (to rectify the
problem)

I would say that *most* folks don't have the specific problem that city
dwellers have of driving thru long tunnels, and on the lower 'deck' of a
2 deck bridge (or raised roadway)

I drove from Boston, down to R.I. last weekend with my tracker up and
running. I didn't notice anything wrong (I was paying attention to
driving more than reading my GPS screen) untill late in the afternoon
after I had been parked for hours. There was a notice to check the
message screen. When I did, it told me something to the effect of "Unit
is unuseable. Power down then power up"

When I did that, I waited for 'lock' and it took less than one minute!

Has anyone else noticed this?

```
It would be great (I think) if we (APRS users) were able to make this
connection (NWS real-time data => APRS network)with the NWS, and create
a two-way exchange of Wx data to the benefit of both groups.

Some ideas for getting the data, not knowing the hardware setup there
these may or may not apply;

1. If the APRS computer has access to the LAN in the NWS office, then
you should be able to manually go to a server and get a copy of the data
and save it on your local hard drive, where you can then do with it as
you wish.
You of course would need read permission for this drive/dir granted to
your workstation. The data could be dumped to your local drive by the
NWS where APRS could find it either manually or automatically(this would
not require read permissions on the server, only a dir on your local
drive for them to dump data into.

2.  A patch (or .bat file) called up from within APRS could
automatically go and grab acopy at preset intervals and save it locally.
```

Bob(APR) could probably write this into specialized copies to run at NWS sites only, and also delete or include other portions of APRS that have no value to this specialized application of APRS. Maybe Bob would take a second look at tweaking APRSNet for this function.

3. The creation of a new module, an APRS server dameon which could handle modem, ethernet, or packet connects and serve out the Wx data, and having its display limited or user configurable to only those map symbols desired (Wx stations and Wx symbols only), dumping the telemetry screen and having in its place a Wx summary table (a print function would be nice here also!). This dameon could also serve as a the previously discussed internet connection for long distance linking of local nets, moving the data by implementing and sending e-mail in the proper format for the 'net to handle.

4. How about a version for a as yet un-tapped OS (Linux/UNIX), the capabilities would be tremendous (Keith/Mark - will your WInAPRS port over to UNIX without much trouble??). I don't know the answer to this but have read that C and C+ can be ported to Linux (and yes I realize WinAPRS is not written in C or Visual C), can anyone answer this question?

Just my 2 cents worth, if I had the time and coding ability, I would tackle one of these ideas, but till now they have just been what-ifs I have dwelled on from time to time.

========

On another subject, while I am on the soapbox, I would support and like to see the development of a high speed backbone on 900MHz, there is existing equipment used for LAWNs (Local Area Wireless Networks) which operate in the 902-928 band as low-power devices without a license. MAX power out is 1 watt, and a claimed range using omni antennas is 10 miles. What stops us from using these same devices to establish our own net in a band that we already have access to but with slightly higher power output if needed to establish high speed links between WIDEs, the link station could reside at the same site as the 2mtr WIDE, and use yagi or omni antennas to link to other WIDES, the 2mtr uplinks of local stations being ported over to the 900MHz spread-sprectum backbone.
Am I dreaming or what. The only thing better than this would be LEO sats dedicated to APRS.

73..."And keep those batteries charged!"

151. Garmin GPS-31 and Plots Screen

I have just received a new Garmin GPS-31 TracPak all in one receiver and antenna, but no display. It is about the size of a mouse and has some nice features. Two serial output lines, most all of the common NEMA strings, low power consumption and a 999 Knot limit. This brings up a little problem though. Now when I am streaking down the highway at 70 mph it only shows me at 60. Does anyone know of a undocumented command to change it to mph? I am currently installing the nitrous kit on the Jeep to see if i can crack the speed limit of the 31. If you see a red streak but don't hear anything go by, it's just me. Boom to follow.

I should also report to Bob (APR) that the GPS PLOTS works great with the 31 and is real handy, thanks. Would it be possible to convert Knots to MPH (as a set up option) within APRS? And then show speed, Lat-Lon, and a compass heading in a box on the PLOTS screen?

```

Perhaps it has something to do with the version of firmware you have?? I when I have lost lock,(on my gps-45) the gps beeps and gives me a message something like 'poor gps coverage'. When I get back in the open, it regains lock and keeps going.

Ted (KJ6ZJ)

I seem to be having a problem with my Garmin 45 that I don't remember being mentioned here on the sig.

I had suspected it before, but after this past weekend I'm sure.

If my 45 looses 'lock' it seems to be unable to re-aquire 'lock' without

POWERING DOWN, THEN POWERING UP. This, of course, requires operator attention (to notice the problem) and operator action (to rectify the problem)

I would say that *most* folks don't have the specific problem that city dwellers have of driving thru long tunnels, and on the lower 'deck' of a 2 deck bridge (or raised roadway)

I drove from Boston, down to R.I. last weekend with my tracker up and running. I didn't notice anything wrong (I was paying attention to driving more than reading my GPS screen) untill late in the afternoon after I had been parked for hours. There was a notice to check the message screen. When I did, it told me something to the effect of "Unit is unuseable. Power down then power up"

When I did that, I waited for 'lock' and it took less than one minute!

Has anyone else noticed this?

153. GE Radios and retuning

From: gphowell@interramp.com

Message-ID: <199606050004.UAA19340@smtp1.interramp.com>
Rendered body type: text/plain

Ralph's comments about GE Custom MVP's and the like absolutely correct ... with one or two caveats. With the Custom and its brothers, the Exec II and Master II, either highband (2 meter) split can generally be made to come down (or up in the case of the low split version) to the ham band. Low split radios tend to be rare, as they were mostly export.

With the UHF radios, you must get a mid split -- i.e. 450 to 470 front end -- to have any hope of making them work. Make sure whoever you get these gems from will either take them back if wrong or can show you that they are the correct split. If not, you can pitch them, 'cause the 470 and up front ends won't make it to 440, and neither will the 406 to 420.

All three types could be supplied with a 10 dB preamp which was mounted in the front end and plugs in to the front end RCA jack. Sometimes these cause more problems than they solve, as the devices tend to have problems with intermod in high RF areas. They were meant for mobiles not stations.

Century II radios will generally tune -- they were pretty broad banded.

Custom and the like used channel elements for transmit and receive -- same thing for Custom and Exec, but Master II needs a different animal that GE calls an ICOM -- Integrated Circuit Oscillator Module. More stable device than the other style. Also, MII used two different types of exciter -- a phase modulated one and a true FM type, which are not common. I don't believe the former lends itself to 9600 very well. All the custom and Exec II radios were phase modulated. Make sure that you get half a dozen or so elements so you can be sure of having two that will work.

Century II uses plug in 3rd overtone type crystals in the 45 meg range. The others use solder in HC-12 types ranging from 12 Mhz range for TX to 16/18 Mhz range for RX. IF's on these radios were generally 11.2 Mhz for all bands.

Our club has been using an Exec II as a digipeater for a number of years, with good results, and I use a Custom for 145.01 on my BBS.

Hope this information is helpful.

Message-ID: <199606050022.UAA19945@smtp1.interramp.com>
Rendered body type: text/plain

There have been lots of comments flying around the sig about Joe Agrello's df Jr. Here's my two cents worth.

I ordered the system COD, knowing that the wait would be a while. It was waiting for me when I got back from Dayton (got to meet Joe and Eric Larson, the sales manager for Agrello Engineering while at the hamfest, a bonus)

I put the antenna unit together, and tried it out. It did not work correctly. After poking around a little bit, I determined that one of the coax lines was shorted, and fixed it. Sent Joe a note about the problem. He immediately offered to replace the entire antenna box.

I tried it again, and still didn't work, determined that one of the active devices in the box was bad, probably from running with the shorted line. I let Joe and Eric know about the problem, and even though I know they were working furiously to get out the upgraded antenna kits -- all that shipped before May 22 got a mod to improve reflection rejection -- I got my new antenna box in a very reasonable time.

Installed it today, and all appears to be working just fine. Thought I haven't had time to check it out thoroughly, things seem to be doing what they should, and for once, the advertising seems to follow the product. Refreshing.

It is nice to deal with a company that responds quickly to customer problems. Agrello Engineering gets an "A" both for a good product as well as excellent service. Thanks guys

Just get used to thinking in knots. It helps if you can convince the policeman to do the same :-)

Couple of questions about the 31 now that we have a bona fide user:

How does the power management work: does it need its own power supply or is it miserly enough to run off the computer's serial port? I assume if PACCOM can run a GPS from the TNC's power supply that the 31 might be similar.

Can it take waypoints and output the waypoint navigation features of other GPS's?

Does it have the same engine as the 45?

Do you like it, with all the vast experience you've had? Sounds like it's the cat's meow as a tracker or with a computer interface.

It seems all the versions I have tried are DOS . I tried the winaprs
on the TAPR CD but it tells me the beta test time is up June 1st ,
then stops . Do you know where I could buy a registered version of
winaprs  ?

I've had the same problem -- mine has lost lock when all visible birds should be
in the clear, for instance, while driving the Interstate in Iowa last month with
nothing around but cornfields.  (I'm also using the Trimble patch antenna)  The
unit works fine for hours, then for no apparent reason, shows "Poor GPS
Coverage" and must be "rebooted".

Will try defeating the "power saver" mode, as suggested by KB2TGH, and I'll let
you know if this makes a difference.  I normally use an external 12 V supply --
it would be nice if Garmin modified the design to automatically shut off the
"power saver" when external power is present.

Hi Folks

About a week ago there was a note from kd6pbh regarding a kit to display
lat/long etc from your gps board. I was in the middle of developing one
myself at the time but since I saw J's message I took the lazy way out and
ordered one. Just to let everyone know it works very well, excellent service
from J, takes about 30 mins to build, worked first time. The kit consists of
a small pcb with a 20pin 68hc705j1 micro and a backlit 16 character x 2 line
lcd.

Well done J!

Hook your position you want to change.
Hit "I".
Hit "My Position"
Enter Lat
Enter Long
Hit "Buildings"
Hit "my Qth"
Enter
Enter
Enter
Enter
"Y" for yes
Spacebar to redraw map.

And your wx station is changed to a QTH, and will stay that way...unless you
have a WX station sending reports out as determined by the value in Alt-S,
Pos Rate.

To change your symbol, just get the cursor over yr position, and re-insert
another symbol.

See /readme/help.txt
"INPUTS MENU:  Lets you ADD objects to the map, or input data on your station."

about halfway down in the document.

I just checked my unit:

Version 2.43
Normal Mode (NOT battery saver)

I forget to mention something else I noticed that day.

While my sig lines say "Boston" I actually live in a suburb about 10
miles north. Going home from R.I. I had to travel thru the *center* of
the city. Since I had noticed this "problem" in R.I. I was more attentive
to the GPS screen on the trip home, particularly the singnal strength screen.

I had reasonable sat coverage all the way from R.I. with coverage
ragnging from 4 to 7 sats. But when I approached downtown Boston I
noticed that both the number of sats and the signal strength got less and
less until I was down to *zip* (still "outside", not under any
obstructions, bridges, tunnels, etc)

Since Boston (like many/most metropolitan areas) is awash with RF, I'm
tempted to think that this is some sort of intermod, or overload situation.
Once past the downtown area, I powered down, then up and re-aquired lock.

GPS was powerd by external 12v 15 amp hr gel cell
antenna was the QST "patch" antenna on the front dashboard

If you check the documentation for WinAPRS you should find the address
to register it or Contact the Sproul Brothers here. In a just previous
message I got Mark Sproul's e-mail address. Contact him for registering
a copy.

Contact Mark via e-mailat:    dgc@renc.igs.net
or his homepage is :http://msproul.rutgers.edu/

Hope this helps, 73,

Roger Sellers

Yep, mine has done the same thing out on the Atlantic Ocean.
This "feature" does not happen often, and the only warning
is the beep beep "poor coverage" message.
Power cycle the beast and all is well.

Anyone have a casue and/or solution to this problem?

Yes I have noticed this, and have talked to Garmin about it. It was present
on my original Garmin 45 with a s/w version I don't remember, and it is
present to a somewhat lesser degree on my replacement 45 with a s/w version
I could look up it you wish. Garmin claims it is the unit going into the
long 7 minute search the entire sky mode (there is a proper term for that).
But I find that it will lock in 7 minutes sometimes, and sometimes never
lock. I will say this, I have had it side by side with a Magellan. They both
will loose lock under the tree or too close to the building, but the
Magellan will re-aquire lock MUCH faster than the Garmin. Frankly, I think
it is either a bug in Garmin s/w, or just poor design of the s/w. The fellow
at Garmin did admit one thing to me, and that is that on the 45 they are
flat out of memory for increased code.

My solution, use a good antenna and don't loose lock. If you find a better
solution, please let us know!

The Garmin 45 still looks at the battery level even when external power is
supplied and will shut down if the batteries are weak.  This may only be
true for some versions of the 45.

Rendered body type: text/plain

Well, I believe that I am the cause of all the RS232 questions... so I'm going to relate my ENTIRE experience getting the DFjr to work and let you all judge for yourself.

I ordered the unit on the first day they were taking orders and received it about a week after it's original promise date...all things considered, that ain't bad for a new product.

Construction of the unit was fairly straight-forward even though the manual is "terse." The manual did an adequate job of explaining what had to go to where. My only real criticism is that the drawings that illustrate this were at the very back of the manual and I didn't know that till after I was already done. (A mention of the drawings in the text would be a "good thing." ;-)

The "addenda" had been published about two days BEFORE I received my unit...and I knew the shipping date, so I knew I had to make some mods. I did try the unit without the antenna mods, and got the results I expected...they need the mod! Being the impatient type, I canibalized another mag-mount doppler system I had, and used the magnets on the DFjr system.

I took the unit out for a test spin and it worked fairly well on strong signals...(repeaters being the only thing I really could find in abundance at 8pm..) This isn't to say that the unit doesn't work with weak signals...I just haven't had a chance to use it that way yet.

Saturday rolled around and there was a special event happening that evening. A friend of mine was hosting his last hunt as the "fox-master" and I had a special invite to attend. I wanted all the tricks up my sleeve possible so a couple buddies and I started working on the APRS mods(a good use of my newly arrived Garmin 45..) We dutifully reversed one of the modular connectors on the RS232 cable, and removed the solder jump as described in the addenda.

We plugged everything together and took it out...no joy. So, back to the barn. I pulled my scope out to the car and started looking at the RS232 interface. The documentation has a pin-out of the RS232 modular jack. I saw transitions of 0-5V coming on pin 4 of the modular jack. We plugged the the computer in, and these serial data transitions went away. I looked at the data coming out of the computers' serial port and saw 24V transitions like I'd expect on it's transmit line. The computer saw nothing from the DFjr? After trying different combinations for about an hour I disappointedly put everything away and started concentrating on getting ready for the hunt. Needless to say, I was a bit hot under the collar about the whole situation.

Someone posted a request for info on the DFjr that I replied too on Sunday morning....thus causing the whole string of posts about whether the DFjr has true RS232 or not. I saw all this stuff when I came into work on Monday morning. I took the DFjr to the lab here at work and popped the lid. Sure enough, contrary to what I expected, there was a Max232 there...this chip generates real RS232 levels off of a single 5V supply(I've used em myself previously.) At this point it seemed that my unit probably had a defective Max232 circuit. I dropped another note the the gentleman I had originally replied too updating him on the fact that there really WAS a true RS232 chip in the DFjr, and that something was apparently wrong with my single unit.

Coincidently, I got a call Monday morning from Agrelo Engineering asking about how they should ship me the antenna update. They had tried to reach me Friday, and hadn't suceeded. We got that business straightened out and I took this opportunity to finally make them aware of the problems I was having. I spoke to Joe directly. We agreed that there probably was a cap in backwards or some such, the Joe was distressed that their testing procedures hadn't caught them...he described these to me in detail, and the procedures SHOULD have caught the problem...they literally plug the unit into a PC and see it send data on the test bench. He also immediately offered to ship me a new control unit! I'm stubborn and wanted to track the culprit down myself...so at lunch time I went home and popped the lid again. I took an ohm meter to each of the caps around the Max232 to determine how they were wired up...and all of the polarities looked right? Next I put power to the unit, and fed an audio signal at it's scan rate into the unit. This should cause RS232 signals...sure enough, there were true RS232 levels now at the unit's RS232 connector. Humm.. at this point my best guess was some sort of cold solder joint. I reheated all of the caps and closed the unit up. I hooked the adapter T back up and plugged in a computer...I still didn't see anything coming out on the computer? Well, there must also be some sort of problem in the cabling or someplace else still. Lunch time was over and I had to get back to work. I dropped another line to Joe telling what I'd found so far and went back to work.

(At this point I was also feeling ALOT chagrined cause I hadn't seen my infamous 5V signal anyplace on the unit. I really didn't like the "cold solder joint" theory much...)

That evening after dinner, I went out to my bench at home and attacked the problem again. I plugged everything together and started looking at the adapter with my scope. The first thing I saw was my 5V ghost signal right on pin 4 of the adapters' modular connector. I went back over to the DFjr and looked at pin 4 there and there was a strong 24V transition? I looked at the pin-out again...pin 3 was a N/C? Humm...well, it turns out that the RS232 cable that was shipped DIDN'T need to be swapped per the addenda! What I was seeing was 5V worth of mutual inductance! When you have a 24V AC signal and another un-terminated line next too it for several feet in the cable...you can see things like that...thus the cause for my wild goose chase. Moral of the story...don't RTFM ;-)

I put the cable back to it's original condition, i.e. un-swapped and everything is working just fine.

There are a couple things I want to say in this post besides the above story. Saturday I was pretty hot under the collar. Sunday wasn't alot better, and the post I sent to the other gentleman complained about paying alot of money for gear that didn't meet spec. That was untrue, though I wasn't aware of it at the time. Agrelo engineering hadn't been given a chance to correct the problem either, it was the weekend. Agrelo engineering did everything reasonable, and then some, to try and take care of my complaints once they were aware of them.

Those are the fact...you guys can judge for yourselves.

73 de Steve KA6S

Date: Wed, 5 Jun 1996 14:33:31 -0500
To: aprssig@tapr.org
Message-ID: <v02130500addb9090729b@[199.1.11.111]>
Rendered body type: text/plain

>Could someone explain to me the "real" difference between battery saver
>mode and normal mode in the Garmin 45? The manual is very vague about it.

```
>From the Garmin45 FAQ
---------------------------------
-How does BatterySave mode work?

According to Garmin's Tech Support Department- These are a couple of  the
things the saver does:
1. Stops the unit from trying to re-lock if it loses the birds.
2. Cycles the receiver off and on periodically if you are motionless. (update
   time)
Ralph Fowler (rwf@mindspring.com)

However, most people feel that the BatterySave mode offers only a modest
battery life improvement in general use.  If you have a strong signal, it
probably does not hurt to leave it in Battery Saver mode.  If you
change modes, then the unit loses all satellites and must reacquire them
(although it happens quickly).  Also, as is mentioned in the manual, when you
have trouble getting the receiver to lock on the satellites, if you turn the
unit off and then on again it often performs better.
[Lane A. Holdcroft]

The RF circuitry draws considerable power.  In normal mode it is on
continuously.  In battery saver mode, after a lock is established and
the necessary data downloaded from the required number of satellites,
the RF circuitry is turned off for short periods, then back on.  If the
user's velocity vector is constant during the off period, then when it
comes back on, the satellite signals will be right where the receiver
expects them to be (in time).  When the receiver verifies that, it can
go back to sleep again for another short period, saving the batteries.
If the signals are not where expected, if the velocity change is small,
the receiver can quickly find them by searching either side of the
expected time delay.  Obviously no change in velocity can be detected
while the RF circuitry is off.
|
The conclusion is:  If you are going at a nearly steady velocity under
a clear sky, use battery saver mode.  If you are under trees with
marginal signals, or want the fastest possible response to velocity and
direction change, use normal mode.
|
Larry James (lwjames@csn.net)
|

Here is another person's explanation:

The battery saver mode cycles the receiver portion of the GPS on for one
second and off for two (then repeats) to conserve power.  The CPU portion of
the GPS is on continuously and interpolates speed/position during the off
cycle.  If the GPS has a hard time keeping up with speed/heading changes
(i.e. a "high dynamics" situation) then Battery Save will automatically be
overriden in favor of Normal mode operation.  It will revert back to Battery
Save operation (again automatically) once speed/heading readings stabilize.

Battery Save mode will not affect the units ability to lock onto satellites
or its ability to re-lock if it loses satellites.

-----------------------------------------------------------
I always use normal mode and have not seem these problems,
but have seen high RF turn on the Garmin-45 when I had it off.

Rendered body type: text/plain

Just thought I would mention, I run APRS74 on a PCjr with 640 base memory. I disconnected the internal 360 floppy and outboarded a 720k floppy drive. Using dos 3.3, I was able to make a boot disk that includeds enough of APRS and one map to work just fine. This alows for automatic reboot in power outages.

Of course with a seperate boot disk and aprs disk it would be possible to add support for other APRS features and more maps.

A mobile running on floppy (s) could easily have different floppys made up to insert to cover maps for a long journey.

However I have not been able to run APRS on my HP-95, I guess I need more memory.

When I run my 45 from external power there is *no* battery condition indicator on the left side of the screen (as is shown when under internal power), but I have seen other 45s that *do* show the battery level with external power.   (didn't check the version numbers....darn)

Well, I've said it before... Bob, you have a *heck* of a good program! I
run *two* 24hr APRS stations, plus my occasional tracker. I'm not a 'new
user' but there are things I still can't figure out, and apparently I'm
not the only one.

The 'on line' help system is minimal, and could stand gobs of inprovement.
(and I don't count the ability to read the "readme" files withing APRS as
'on line' help)

>external power.   (didn't check the version numbers....darn)

Yes, it was changed in a recent version (2.43, I think). Users had no way
to know that external power was good or bad (unless it was bad and they
finally ran the batteries down). So Garmin made the bar graph go away when
external power was present.
I was glad to see it.

None of my Garmin 45s (I have had 2) stopped working when the inside
batteries died (unless the external power was not good)

Rendered body type: text/plain

```
My Garmin 45 is back at Garmin for the second time in the last 2 months.  It quit acquiring lock.
Powering down had no
affect on the problem.  Battery save mode had no affect on the problem.  It runs on external power 99%
of the time.

When the problem occurs, the GPS 45 will shut itself down after about 15-20 minutes and no satelites
acquired.  There is no
indication at all on the S-meter display when it is having a bad time.  I have tried for a couple of
days at a time before
sending it back to Garmin.

I bought the GPS 45 last summer and used it continually on the dash of my truck or my wife's minivan.
It worked fine on a
trip through NM, AZ & CO.

Garmin had the unit back to me in 2 weeks, and it worked fine for a couple of months.  They gave me no
explanation of what
was done to fix it.  I'll ask this time.

188. gps20/mim Power requirements.

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Thu, 6 Jun 1996 09:02:52 -0700
To: wb4apr@amsat.org
Cc: aprssig@tapr.org
Message-ID: <199606061602.JAA07590@poseidon>
Rendered body type: text/plain

```
Hi Bob,
   Reading tech specs on your GPS20 Sensor Board handout, under 1.3.3
Electrical Characteristics:
   1. Input voltage: +5VDC +/- 5% regulated, 50mVp-p ripple.
   2. Draws less than 180mA @5 VDC. ........etc

Will the GPS20 take 5V to 40DC like the GPS45 or 5V DC to 12Vdc, and similar
to the MIM module.
   To take required 5VDC from MIM for the G20, MIM uses 15mA leaving 85mV at
+5V, which not enough for the G20 if it uses 180mA..
   Can the MIM power also run the G20, or is a seperate regulated 5V supply
at from 5V-40V required for the G20. ???
   Want to package the two together for nice small unit, but concerned about
appropriate power supply, or does GPS20 have its own 5-40 regulated 5VD ??,
and just not mentioned on the spec sheet. .
   Thanks for clearing up my puzzlement. Have both on order and have also
received the KD6PBH GPS display kit for the Magnovox 4200 and this unit. Place
Dispaly on cars dash board, to insure unit putting out good data and visual
info right in front view while driving. Easier than lookin at a Laptop on seat.
  Thanks much 73's & Enjoy, Bill/WB6LPG

```
I just uploaded 76b to tapr.org in tapr/SIG/aprssig/files/upload
When I log off here, I will prepare the 76to76b.zip file and upload that
this evening...

NEWNOTES.TXT     * * * *  NEW STUFF ADDED IN EACH NEW VERSION  * * * *

Ver 76b: MAPFIX25 now uses a BUS MOUSE and has 10 times faster FIND cmd
* Fixed DFjr interface so that GPS and DF unit work together.  See DF.txt
* Added main menu to bottom of most APRS screens.

Ver 76a: Mapfix24 has 10 times faster TASK-TRIM and has a new command
  called EDIT-SPLIT for splitting a long feature in two.
* New program CKMAPLST.bas will compare your MAPLIST to all the files
  in a given directory and list missing files or missing entries!
* FIxed problem with WX stations fading to gray after 2 hrs
* Fixed DAVIS WX reports with bad baro if no baro present
* Fixed MPH display
* Fixed it so FLUX Compass displays heading even if speed is zero
* Fixed it so that alt-S-GPS-NO-GPS will NOT cause you to fade to gray
* Mic Encoders will now trip ALARM if message 6 or 7

Ver 76: Dayton 96 version  (4k larger than 75c)
* Added Davis Weather Monitor
* You must twiddle your alt-S-OTHER-AvgGndLevel to get the proper
  conversion of your barometer reading for the Davis.
* Added Agrelo DF Junior interfaces
* Now displays your course and speed if GPS connected...
* Added ACARS.bk to show how APRSair.exe tracks the Airlines on 131.55 MHz
```

Lay off coffee for a week, buy a soldering iron half the size of your
smallest one, get .001 solder and proceed SLOWLY.

Use the minimum solder possible being careful not to wick up to the front
of the insert clip. Trim off the excess crimp tabs (I didn't have a crimper
to fit). The rear of the clip MUST be narrow. Make sure you are inserting
the clip into the correct slot.

I had no UNRECOVERABLE disasters. I'd have paid big bucke to get that
connector pre-assembled.

191. Round 2 of Garmin GPS-20

From: Greg Jones <wd5ivd@tapr.org>
Date: Thu, 6 Jun 1996 14:40:00 -0500 (CDT)
To: aprssig@tapr.org (BBS SIG mailing)
Message-ID: <199606061940.OAA02352@tapr.org>
Rendered body type: text/plain

```
TAPR offers group GPS purchase (round 2)             6/6/96
-------------------------------------------------------------

TAPR will be making another group purchase on the Garmin 20 GPS units.

For full details on the purchase as well as information regarding the unit,
please see the following web page http://www.tapr.org/gps

The price will be:
   $169.00 US for members of TAPR
       or
   $179.00 US for non-members
```

This kit will include:

- Garmin GPS-20 (MultiTrac8 sensor) engine (1.83" x 2.74" x .45")
  The Garmin GPS-20 is similar to the Garmin GPS-45

- RF pig tail with connector for unit
  (one end is the MCX male connector
  and the other end will be non-connected - see below)

- power/data cable with connector shell and pins
  (The connector is a subminiature PCB edge connector
  and will need to be built - see below)

- Documentation

TAPR will be taking orders for 75 units, which is the minimum purchase this round. Once 75 units have been purchased, TAPR will order the Garmin units.

TAPR will deposit money when the units are ordered from Garmin and ship when all components have been gathered. Unlike the first order, we do not know how long it will take to fill the 75 orders, although orders continue to be made from the last batch.

We had a number of people asking for the altitude option to be set for higher usage and we will check with Garmin on that on this batch of orders -- but no promises :-)

Please note: This is not an enclosed/sealed unit. It is assumed that the purchasers will be installing the unit in another enclosure for normal and experimental operations.

No 10% Discount for TAPR Members. Due to the nature of the purchase, the $169 purchase price for TAPR members represents the membership discount.

If you would like to order one of these units, you can
e-mail tapr@tapr.org,
phone (817) 383-0000, or
fax (817) 566-2544.

Office Hours: Tuesday - Friday 9am - 12pm, 3pm - 5pm Central Time

Payment method is required upon placement of order (Visa/MC, check, MO, etc).

These units will be useful with current APRS software and the upcoming TAC (Totally Accurate Clock) kit that Tom Clark, W3IWI, has begun discussing with TAPR to do as a kit in the future. For more on the TAC project check: ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

Questions concerning the unit and details on the buy will be handled on the TAPR APRS Special Interest Group list. To subscribe,
send e-mail to:
listserv@tapr.org.
In the message type
subscribe aprssig YourFirstName YourLastName.

The server will then send you a message back. Announcements on the status of the shipment will be made to the TAPR APRS SIG and TAPR-BB lists.

Shipping and Handling

- Shipping and Handling within the US will be $7.00 US
  by UPS Ground unless otherwise requested by purchaser.

- International Shipping will need to contact the TAPR office and get a quote on the shipping to your country. TAPR uses International Express Mail, unless the purchaser requires something else.

General Information

All Garmin engines come complete with DGPS input capability (see note below), PPS timing output and lithium 3V battery on board.

MultiTrac8: Tracks and uses up to 8 satellites for accurate, reliable

GPS data at an incredibly low 1 watt power consumption. Unit has and a real time clock, PPS timing and nonvolatile memory right on the board.

Footprint (1.83" x 2.74" x .45")

Architecture	Patented MultiTrac8
Time to first fix	
reacquisition	< 2 sec
warm	20 sec
cold	2 min
sky search	15 min
update rate	1 sec continuous
Dynamics	
velocity	999 knots
acceleration	3 g
jerk	20 m/s^3
Datums	102 predefined, 1 user defined
Electrical	
input voltage	5.0V DC +- 5% regulated (a suitable regulator should be used)
power consumption	0.8 watts
backup	on board 3V lithium (10 year lifetime)
sensitivity	-166 dBW
Connector	
antenna	50 ohm MCX female connector for active (5V DC @ 15ma) or passive antenna
power/data	single row, right angle 12 pin male
Physical	
configuration	1 integrated board engine
size	1.83"W X 2.75"L X 0.45"H
weight	1.1 oz
op temp	-30 deg C - 80 deg C (remove Li battery for extended usage above 80 deg C)
storage temp	-40 deg C - 85 deg C
Interface	
compatibility	2 RS-232 serial ports
data rate	User selectable baud rate 1200/2400(tx only)/4800/9600
format	NMEA 0183 v.2.0, ASCII
inputs	Initial position, date and time (not required), 2D/3D & earth datum command, RTCM-104 v.2.0 differential
outputs	Position, velocity & time, receiver and satellite stautus, geometry and error estimates
timing output	Timing output with +- 1 microsecond accuracy

Frequently Asked Questions

----

* Any altitude limitations?
  The GPS engines will deactivate themselves above 50,000 feet.

* The Garmins only send out final solutions (NMEA sentences).
  There is no other data available from them (including preprocessing data).

* The Multitrak8 has only one channel, but is multiplexed.

* The Multitrak8 can accept DGPS signals (see note below).

* Antenna options (which can be purchased directly from Garmin if required) include:
    - mag mount
    - flange mount (bolt to a car)
    - trunk clip
    - suction cup mounted

* The unit has true time clocks, PPS timing, and nonvolatile memory on board.

* The interface is NMEA 0183 (TTL levels) and RS232 (+ and - 15 volts)

* The unit can be powered by AA batteries.
  Batteries or external supplies will require a suitable power regulator.

* The unit only gives NMEA sentences as output, no extraction
  of RTCM-104 data.

* There's no problem with the antenna being close to the boards.
  All sensitive components are shielded.

* The unit has a LNAs and you can use passive antennas.
  You need to keep the antenna runs short however.

* The antenna is attached with a MCX connector, which is a friction
  lock connector. A male MCX connector with short RF cable is included
  in the kit purchase.

* There's a header for connecting the data cables.
  A connector and cable will be included in the kit (it will need
  to be soldered). The connector is a subminiature PCB edge connector.
  This is not the same connector as used with many hand-held units.

* You cannot adjust the intervals that the boards outputs data.
  However, you can adjust their baud rate. At 4800 the boards repeat
  data every 2 seconds. At 9600 baud, data is repeated every 1 second.

* The boards do adjust for leap seconds (via the satellites).

* For DGPS, since these are just the boards, you can't use the Garmin DGPS
  receivers. The Garmin units get tuning instructions from the GPS keyboard

  (which are not on the boards). To receive DGPS signals, you'll need a
  tunable beacon receiver. Correction signals are sent in through the
  data in cable (just like the handhelds).

Hi All,

As co-chairperson of my club's Field Day committee, I'll
be setting up APRS at our Field Day site in Putnam County NY
as a WIDE. As many of you in the New York-New Jersey-Connecti-
cuit area already know, there is (what I refer to as) a APRS-
Black Hole there. I've distributed MANY copies of APRS to club
members in the past but it's a hilly area with few stations on
APRS (YET!) I'll be informing them of this fact and, since the
Field Day site is also the club's repeater site (it's the
145.130 machine) I hope to do fairly well.

```
     The "new" 286 laptop I picked up at the Rochester Hamfest
will be put into service for the first "serious" time and, if
all works out as hoped, a new geographic area for APRS will be
connected to the rest of the network (at least during Field
Day) for the first time.  Since I'm a "no-code" and since the
guy who was in charge of packet contacts last year came out
bust, I'm looking forward to getting a few *ACK*s and convin-
cing the club to (puh-leeeeeeeeeease!) put up a WIDE digi at
that site on a full-time basis.  Wish me luck.  73 de

195. DOA PicoPacket

From: Kent V Hufford <khufford@erols.com>
Date: Fri, 07 Jun 1996 01:45:30 -0400
To: aprssig@tapr.org
Message-ID: <199606070145.VAA02102@smtp2.erols.com>
Rendered body type: text/plain

```
Hi, all. Just got a PacComm PicoPacket w/second serial port in the mail.

Seems to be Dead on Arrival (DOA). Maybe someone out here can help.

When I put 12dc to the power connector (I checked polarity first) , then
turn on the on/off switch, all I get is the CON lite. No LED blinking or any
other lites.

The manual says in that case to check with a "good oscilloscope" p93 of U1.
I did not buy a "good Oscilloscope".

So, on to the next help. I checked pin32 of U6 for 4.7 volts, it has 4.9.

It also says that U6 is the 128K RAM. The current advertising says the
PicoPacket w/second serial port comes with 128k ram. A slip of paper in my
box that the TNC came said "Ram greater than 32k is not yet supported". So,
there is NO 128k chip in the TNC.  But it does have a U6 header..

Any ideas, other than back to PACCOM?

thanks in advance.

Kent

Bob just installed version 76b and i found that when i place an object on
the map with a speed lets say of 35 mph it doesn't move on my map, but it
does on the other fellow i was testing with. He was running a Mac.
Now i attempted this several times with weather objects and like i said
they NEVER move on my own map.

I just checked, and the DR of OBJECTS works fine and all the WX symbols
in my area have WIND leaders and they dont go away, so I guess those two
reports need more watching to see what is going on.

Bill, an object wont move unless the following conditions are met:
1) OBJ has a course and speed
2) You have UPLINK enabled
3) You have DR enabled

THen it will move, but ONLY each time it is transmitted...
AND
at least one minute must have gone by

Lemme know what you figure out...

> obstructions, bridges, tunnels, etc)

That isn't the way I experienced it.  I had fairly good coverage most of
the time in Boston (except when it could be explained by obstructions).
(By the way, did you see on the track that I went right by your house on
the return trip?  I was within a mile by GPS readings!)

> Since Boston (like many/most metropolitan areas) is awash with RF, I'm

214. NWS Wx (rain) Reporting Conventions

From: schiers@ames.net
Date: Fri, 07 Jun 96 09:21:28 -0500
To: aprssig@tapr.org
Message-ID: <199606071442.JAA16001@tapr.org>
Rendered body type: text/plain

I met with the people at the NOAA (NWS) service yesterday. What fun! I never saw so many large hi-res computer monitors with doppler radar on them in my life. I felt like a kid in a candy store.

I took a printout of the messages that came up in this sig regarding how the rainfall should be reported and we adjourned to a rather nice conference room with several of the NWS employees sitting around the table to discuss the issue. They haven't changed their position, but they did clarify what the California office said, and how that could be misinterpreted.

For the purposes of INTERNAL reporting, the NWS office cuts off data at midnight. They maintained that this was for their internal purposes only and ALL interfaces with the public are based on the 1200 UTC cutoff. The reports they receive from reporting stations, and those they release to the public are based on the 1200 UTC cutoff. Apparently they have a very large number of people from the public who are "semi-official" rainfall reporters and they make use of this material. They want it, they use it, they redistribute it and it is all based on the 1200 UTC cutoff.

When I asked them why the disparity between their "internal" cutoff of midnight and the "external" cutoff of 1200 UTC, they said, "How many reporters are going to get up at midnight to read/reset their rain gauges?" They want the information from "reliable external sources" and to maximize the availability of data, the time agreed upon was 1200 UTC. I further asked if this was idiosyncratic to Iowa or typical of the nation as a whole and they indicated that the 1200 UTC cutoff was typical as far as they knew.

I again went into the 60 minute sliding period versus "cardinal" or on the hour rain reports. They were unequivocal, ON THE HOUR, no sliding periods.

So where does that leave us?

The best solution from my point of view, if we cannot have agreement on a standard that makes sense and can be compared to what NWS is reporting is to allow the USER to determine the reporting period cutoff. It should not be a terribly difficult job of coding to let the user specify the "day ending" cutoff hour for rain (precip). Then everyone can tailor their cutoff to local/state convention.

I see no reason to use a sliding 60 minute period for definition of rainfall in the last hour. The last hour should be current accumulated rain since the top of the hour.

If I understand how APRS would use the R and P fields it would work like this:

The r field is RAIN, The p field is PRECIP

rRAIN = accumulated rain since the top of the hour (no sliding 60 minute period)

pRAIN = accumulated rain in the last 24 hours (with the cutoff hour being user defined)

This is all I can contribute to the topic. Hope it helps the authors come to some conclusions. Please....I am not looking for an arguement. I am reporting what the NWS guys told me and making a suggestion about how to build flexibility into the programs so each USER can do what he/she prefers. 73,

Yep, I found the missing WX wind speeds. It got messed up when I added
the MAGNETIC COMPASS interface!   The OWN-STATION heading
must be non-zero or APRS76b will not display ANY winds or mobile leaders...

You can force a heading with the INPUT-HEADING command.

Although this necessitates a new release, please keep using 76b if you
have it and report any additional bugs?

I think this was asked before but i never seen an answer to the question. Is there any information avalable (Maybe from Bob hi) that would explain how to setup APRS and it's many different ways to run it. Sure would be great to have a manual available. Like what are all the keystrokes, and what do they do!. Also how does a person setup for mobile operations using a laptop (With ot without GPS, Doppler, How is a weather station setup etc etc. APRS is getting to a point where i have even seen Bob answer a message with (I will have to check that). I have read trough all the txt files and there realy isn't anything concrete. I wouldn't mind making up some maunuals, and making them available to those that feel a need for them, (LIKE ME)!. But of course i need the info first. This came to mind a while ago trying to setup for running GPS with my laptop, there realy is no step by step of anything in the readme directory. Bob do you have a list off all commands and their functions???.

It's searching for satellites. If you have a good antenna connected, it should find them.

IF you have the development kit, use CFGPS.exe, TSIPCHAT.exe, thence CFGPS.exe
to go to TSIP mode, tell the GPS presumptively where it is and the current
date/time, and maybe that it's a land application, then go back to NMEA mode.

> Can somebody help me to understand this and to find the mistake in the gps
> board.

Doesn't sound like a board problem. Sounds like a satellite acquisition
problem.

Not directly regarding Precision Mapping but about a year ago I was
in a computer store in Charleston SC and saw that a new (then) NEC
laptop was selling with a bundled mapping program. This software

was RS-232 ready to accept & display NMEA strings as map overlay
icons.

Can't recall the name or mfgr of the software. Is anyone familiar
with this package ?

Members of the Scranton Pocono Amateur Radio Klub (SPARK), K3CSG, will
be participating once again for this year's FD. We will be doing either
a 3A or 4A effort for the weekend, and plan to utilize VHF APRS and
keyboard Packet.

A vertical antenna will be replacing the 5 element beam at K3CSG-5 before
FD weekend, and this should provide adequate coverage for most of NE PA.
I am unaware of any other local club who will be on in this area.

I will post a message to this SIG when the new antenna goes up.

...
>hasan schiers, N0AN--
>--
>schiers@ames.net
>--
>

Here's another 2-cents worth... Top-of-the-hour rain amounts are
easy to program for but often accurately indicate the most recent
activity - 2 inches of rain from 1:30 - 1:55 may indicate /R000 at
2:05 - that's alot of recent activity to be showing /R000.

In considering the 24-hour rain amount, I prefer midnight resets
because (1) the Ultimeter 2000 automatically resets daily rain
amounts at midnite (as pointed out in the WX.TXT docs) and (2) it
seems more logical when referring to "today's rainfall amount".

Although the NWS certainly likes to see local rainfall amounts from
different sites, the amounts can vary so much over short distances
I'm still not sure what the importance of the remote readings really
are. (Here in West Texas, rainfall amounts are purely hypothetical
anyway.)

What's important is to make a decision and stick to it. Right now
AutoWx beacons APRS-format using "top-of-the-hour" for /R000 and
since midnite Local time for /P000. As Bob pointed out, the code is
simpler this way, but AutoWx will be changed, if necessary, to
follow whatever APRS does.

BTW Hasan... Your 59 F last evening while we were 96 F (at about
9:00 pm) sure looked cool.

Now all we need is Bob to include the code for logging wx values
every five minutes in APRS. Right Bob? hi

Got the TAPR GPS-20 board connected to the external world and working.

Used Trimble antenna. 7805 regulator on 13V supply for the 5V. The
dissipation is just on the edge of free air wattage of a 7805 so definitely
recommend a small heatsink.

Watch out for that 12 pin connector from Hell. Work carefully.

Came up with clock off by about 10 minutes (slow). In about 15 minutes, the
clock corrected and in about a minute more, got a 7 sat fix.

Data looks good on terminal emulator.

235. SMB to BNC adaptor for Trimble Ant

From: Steve Hall <steve.hall@lerc.nasa.gov>
Date: Fri, 7 Jun 1996 20:00:58 -0400
To: aprssig@tapr.org
Message-ID: <2.2.16.19960607194910.39e741f4@popd.ix.netcom.com>
Rendered body type: text/plain

```
Pasternack has the necessary adaptor (SMB MALE on one side and BNC male on
other) to allow the trimble GPS antenna that PACCOMM sales to hook directly
to a Garmin 45.

The problem is that Pasternack requires a min order of $100.00.  Would
anyone be interested in going together for a group purchase?

The cost of the adaptor is $25.95 each plus shipping.

If anyone is interested or if anyone knows another source with a better deal
let me
know.

73,

Steve Hall - KK4PM
```

P.S. I don't want to cut of the SMB!

Hi Bill,
    Your sig msg on DOCUMENTATION 6/7/96 ...

A recient Packet BBS message, 16-APR 03:21 from N2ZRC titled "How to set up
APRS" appeared and addressed APRS@ALLUS on the Packet system.
Art Booten/N2ZRC is here on this net.

  Tom Griffin/N7ZKL sent out a long APRS Overview dated 8/5/95 on the Packet
```

```
BBS system also, QSO with him for a copy.

   The APRS program README.DIR and it HELP.TXT file and all the others give you
ample info to operate the program.

   The Phoenix LLBBS N7QVU @ 602-938-7528 has a Dedicated APRS files and
numerous individual HELP files origianted by George/W8FWF on how to operate
APRS.

   If you get on Packet BBS system send me your HOME BBS and I can send
you these files, I have them on disk, but cannot get over to this system
and they are too long to type individually.

      Hope this helps you out. 73's & Enjoy, Bill/WB6LPG@KA6EYH.#NOCAL.CA.USA.

Just for the record, all of the APRS README documents are in the process of
being converted over to web pages.  I am also following the process with a
hyper-text document, but that is probably six weeks away from completion.  If
everybody can be patient, I'll make it available ASAP....

Supposedly JustSoftworks just released a BETA GPS interface program. I
downloaded it and it does appear to run at least. Since I dont have a CD-Rom
on my laptop I cant get the software to run on my laptop yet. I put an
inquiry to them to see if I can run the Precision Mapping somehow without a
cd. If I can get it to work, I'll let you know.

I posted this about a month ago, I bought a SMB-SMA adaptor and SMA-BNC
adaptor at a hamfest in Sandwich, Il. I got it from a guy and he said he
has/could get more. He wanted about $10 for them. Here's his info if you
want to check him out.

```
After downloading a mapfile called BSRGMAPS.ZIP from Mindspring.com i found
a readme file included that i found rather in poor taste. Within this file
are many of my detailed maps for Huntsville Alabama yet the credit for
making these maps was changed from one callsign to another. In fact the
text that was in the file was actually written by me except for the KE4ROC
call that was changed, it states as follows.

"Many people have worked HARD on these maps. Some of them are N4QEA, N4NEQ,
and KE4ROC."
    ^^^^^^ was changed

KE4ROC is a very good friend of mine and has made only one map in his whole
life, and that map was not even in the distribution. In other words KE4EER
was changed to KE4ROC. Guys i have made over 800 maps. I worked hard and
many hours to create these maps, i have also made maps for many users for
just the asking, i cannot believe someone (And i know who it is) would
stoop so low as to change someones callsign within a text file giving
another person credit for the maps someone else made. I guess i will be not
be making many maprs anymore.

254. of interest ICOM 706 owners

From: KD4EMI@aol.com
Date: Sat, 8 Jun 1996 09:48:48 -0400
To: aprssig@tapr.org
Message-ID: <960608094847_322021514@emout08.mail.aol.com>
Rendered body type: text/plain

I have finally completed my latest stamp trick... Posted here FYI

If you have a ICOM 706 and want to operate aprs on HF and VHF it can be a problem. You have to manually change bands before the radio xmits.

My basic stamp now can control your 706 (or any radio with rs2332).
All it really does is switch the bands or freq on your radio. Another application is if your running an HF rig mobile with an autotuner, It can switch from 30 meters to 20 meters to 40 meters for you automatically.

Just program your tnc to xmit at a certain interval and tell the stamp when to change freqs. I am working on a way for the stamp to read the output of the tnc (KAM) and automatically change the band depending on if the kam xmits hf or vhf, having some difficulty with that though.

So anyhow, should you want to operate your 706 and not have radios everywhere, the basic stamp should work.
OR
if you want to operate on several freqs and dont want to manually change the freq, the stamp will work there also.

Any basic stamp ideas are welcome..Im getting bored again.

Oh, also, I didnt notice but is there a MAN icon in aprs..? I made a
"MANPACK" unit and thought it might be neat to have a little man icon and
also a horse icon. (demo for the police dept mounted patrol ...)
Not critical, perhaps on a later version..

Later...
Mike KD4EMI@AOL.COM

I had very good success using Word Perfect and importing the
doc files. I called each chapter the name of the file in the
README.TXT Example Chapter #10 was called Symbols.

There is a program utility in word perfect that allows you to put
in key words, example TNC, TAPR, HSP, WX, etc. etc. etc. etc.
I had a very large key word index by just going thru all of the
.TXT files and entering them.

Word Perfect then allows you to SORT this file alphabetically and
it will read thru the entire README and produce a rather elegant
Table of Contents and INDEX and cross reference the key word
to the page # in the document.

This utility is rather industry standard and I guess can be found
in most word processing programs.

Ok People, what is the catch. CD-ROM Mapping and a GPS interface for free (beta)
at what is it $39 ?? Plus a free CD with either the WHite Pages or Yellow
pages...

Many have seen the DeLorem stuff, what is the difference in data quality if any?
As far as I know most if not all of the data is the same since it comes from the
same source. This sounds too good to be true since MapExpert comes out to be
about $300 once you get the GPS Add On shipped to you and you buy the actual
MapExpert CD.

If it is as good as it sounds it seems to be that DeLorem will be suffering from
a short life span!

I have received several of their catalogs in the past and they do have a lot of stuff! BE AWARE I think that their prices are very high, I may be wrong since I have never priced this particular adapter but I would suggest to look a little closer before purchasing.

Call up some 2-way radio shops and see if you can find one that use connectors from RF Industries, they are common. Their connectors are of good quality and they have always had everything that I need. I know that their are several users on the sig that work at 2-way shops and they may be able to get them for you. I work at one but I am not in the position to purchase large quantities of these without a markup and I really do not want to charge sig members a markup so I am going to need to pass on any offer.

BTW just look at the RG-58/U jumpers that Pastranack sells, I think a 10ft jumper with "N" connectors is $30 or more.. Let's get real here!

> Are any other map makers using symbols to put permanent objects on maps?
> Any suggestions for color & symbol type standards for objects

APRSdos REPLY COMMENT: I would not use color 13 violet, since all objects put on the map by uplinking will be violet.

Even if they are the same color, tho, SYMBOLS on maps are labeled to the left and OBJ's uplinked to the map are lableled to the right...

<SPOILER>

If you are tired of following William Nolle's (KE4EER) hate campaigns , please Hit your Delete or Next button now. Otherwide read on for my response.

My Eudora Pro filters all messages from this individual to the trash, but someone else recently forwarded me a copy of another libelous message by William Nolle, KE4EER. In it, he alleges that a map distribution contains a README file written by him and not attributed as such. This person has attacked me in public before and I chose not to respond in public, thereby lowering myself to his level. This time, though, it is a subject that is near and dear to our hearts: APRS.

Authorship of my readme files is not and "claimed" by anyone, including myself, with the exception of APR's and probably the Sproul's files included in their distribution. I have written my readme files and choose to include whomever I wish in my "thank yous". In some cases, I include WB4APR's little "getting started" file so folks know how to unzip the program. Recently, I have even changed that. This is because by the time someone unzips an FTP'd copy of APRS, it is too late to keep from having zillions of files added to the wrong directory. My readme file tells how to unzip the APRS program and maps, which I have encrypted with a password found by reading the readme file. One HAS to read the readme to get the password to unzip the APRS ZIP file. (Bob- this suggestion may help you,too)

If someone gets his feelings hurt because I left their little "thank you" off, then I'm sorry. Maybe you should not venture out into the real world! It is a jungle out here. I have NEVER gotten a thank you for my contributions, nor do I want one. This is my HOBBY! I have registered over 45 copies of APRS for Bob. I think this shows my support.

As to maps:

Many people have been creating maps from USGS CD data using one of several simple conversion programs. As I understand it, the data are provided by the USGS and they probably claim rights to it. I do not believe anyone else can claim rights to a map derived from this source..

There is a designated space in APRS maps for comments. If an Author/Convertor of a map wishes to place comments there, including a copyright notice (for original works), then I strongly suggest that they do so. KE4ROC has done this in his maps of Alabama.

As a person with commercial software on the market, I will give you a little background on copyrights:

I'm not a lawyer and this is not intended to be legal advice.

All original work is "born" with a copyright. It is inherent and exists until the author fails to "protect" his copyright.
If you plan to take credit for something, then you have best include a copyright notice in your work. It should include the date and your name. You should also place the phrase "All Rights Reserved" alongside your copyright notice. This helps reinforce your claim in certain circumstances (mostly internationally). These are several ways to "protect" your copyright.

Once you have done this, you must vigorously protect your copright by making sure that all appearances of your work continue to contain this information.

Note that I am not referring to "trade marks", which may be registered. And have nothing to do with copyrights. Nor am I referring to Patents, which must be issued and registered by the Government.

I have never seen an APRS map that has had any of these steps taken to protect it. As I said before, I think that any map from USGS data affords no claim to the person who used a conversion program to convert it. (other than a nice "thank you" if folks want to do it.)

Original maps *should* have a statement in the comments area indicating the author's wishes. If a person writes a document, the same guidelines apply. Once a file has been released by its author unprotected, to a public forum, then the genie is out of the bottle. You can't undo it. You have failed to "protect" your copyright. Too Bad.

As far as my distribution of APRS maps goes, It will remain as it stands. I am free to mention or thank anyone I wish and will continue to do so. Nothing in it has a protected copyright and I will not distribute anything that does. The APRS program is also available at my site and is intact as Bob released it. By the way, I do thank Bob and the other authors who write the toys we play with.

Now, let's go play with APRS and all of the pretty maps!

Ralph

>From a lead here on the sig, I downloaded the Precision Mapping GPS beta 1.03 from their web site at www.justsoftworks.com. I bought their Precision Mapping 2.0 for $19 a couple of months ago. That is a good program. IT has zoom from the whole US view DOWN to YOUR street level. Move around on your street, it moves with you, compass and all. Good windows interface and too.

NOW, the GPS beta is even better. Just plug in your NEMA 183 GPS in the serial port and it puts you where you are. Has smooth zoom, gives the sat views and levels just like dosAPRS does, but more graphicly.

If you have a laptop with a cd-rom drive this works great. They spent some time writting this program properly. Has good doc's, online. You can set many of the parameters. Yea, if you run a 640k dos laptop or even a windows laptop without a cd, this is not for you. ..But in the future we ALL will have to have a laptop with a cd, if for no other reason than to load new software (I too started in 1985 with LAPLINK).

This program shows what CAN be done with WINDOWS (not windoze).

Now, just wish the Spriol brothers and Precision Mapping would join forces. Seems PM has worked out the windows issues. The brothers have spent many hours working on their WINAPRS versioN. (I'm still waiting for a version AFTER 1.000)

Maybe Bob could team up with PM.....naw...

Congrats in order Mike for a very innovative accomplishment with the stamp!

Regarding your current application to detect a Xmit on HF or VHF merely watch the PTT line on each radio and designated two PINS on the PORT of the Stamp as HF and VHF when it sees a signal present it will now that the PTT has been pushed.

I don't know how fast the Stamp responds but depending on what you are trying to do there may be a work around!

It works. I bought PM 2.0 for $19 at a computer show. It is great.

The beta works great WITH a GPS. However, the beta is good till the end of JUL 96.

But since these guys sold their 2.0 for $19... their GPS version cannot be

```
$100ss?

Rendered body type: text/plain

```
I have an ASCII text file that can be printed out for a 2 1/2 page APRS
QuickReference guide.  It's about 8K text/2K zipped.  Should I post it as a
message here on the SIG, attach it to a post or just offer via direct e-mail
to individuals?

Most command functions/commands are listed alphabetically and show the
keystroke/menu sequence to accomplish the desired function.  Most entries
also show page numbers referring you to pages in the HELP.TXT for additional
information.  (This assumes you print HELP.TXT with one-inch top/bottom
margins.)

I originally made this quick reference at about version 6.7 but have kept it
pretty much up-to-date through 7.4 or so.  If you want a copy, just ask.
Feel free to update it, add to it, etc. just don't send me complaints - you
get what you pay for.

Les/N5KOA

Hi Hi all,
        Newbie question to follow..........

        I'm new to this and been listening very carefully for a couple of weeks,
what I would like to know is, what is the minimum packet setup ness. for
the GPS.  What I mean is I saw a small TNC I think it was the Pico- Pak or
somthing like that...it was only about $50.00...... I'm not very
interested in packet BBS'ing .... but was wondering if 1200 bps is fast
enough or do i need 2400 or 9600?  And if 1200bps is god for APRS GPS
could I also use it for packet mail?

        Thanks..........

Thanks for the suggestion...Tried it and it chops off some of the
characters...It isnt quite fast enough..Im going to try to play with a super
long txdelay though and see if that will work.. Perhaps with a long delay I
could get it to work. Otherwise, yes, I can wire the stamp to the XMIT LED
and sense which is operating.   Will keep you posted.

Rendered body type: text/plain

Now this has some good possibilities for HF APRS! I remember a few years ago
several PACTOR BBS's were programed up to not only move from band to band
depending on the time but also to scan.

Take for instance 40M is good during the morning and so is 80M, 30 meters is
great in the afternoon and early evenings and 80M is good late at night again
barring bad QSB. How about figuring out how to make the stamp keep time and then
having a time table change the rig's band depending on what you feel the best
band is for the time of year.

Another possibility is the scan idea, would be quite crazy and maybe not good
for APRS but how about changing bands at a good rate of speed, and if it notices
a signal have it stop for a predetermined ammount of time. I think that many
rigs will supply S-Meter info on the RS-232 port. If the PTT keys in this time
period then have the scan stop and hold for a longer period of time (in case a
connect is initiated or a ACK is waiting).

>

This would take 3 lines of code. The newer stamps (which I use) have a battery backed-up real time clock. Not a problem.

>Another possibility is the scan idea, would be quite crazy and maybe not good for APRS but how about changing bands at a good rate of speed, and if it notices a signal have it stop for a predetermined ammount of time. I think that many

>connect is initiated or a ACK is waiting).

Im having a great deal of trouble reading the tnc code...I suspect this can be done, I just am still working on it.   It'll hit eventually. Im gonna have to figure out a way to make the stamp look at the code and switch freqs...Thats really rough..Will talk to the stamp geeks and see whats up with that. It would be very easy to just switch freqs every few hours. If you use an autotuner, you could go anywhere you can tune your antenna. Perhaps this would be much easier to code on a home computer...
I recieved a few private mails with ideas for the stamp. I'll list them and see what you guys think...

#1 Have the stamp alert you when someone connects to your tnc...
(not a problem) more code...can be done in an hour...

#2 Automatically sends acks to the aprs 1 liners that people can send you, and store the msgs in memory.

Again, reading the tnc output..Once I figure that out, I can program the stamp to send the acks, save the msgs and autosend them to the mailbox as a msg.   I think this is possible. Therefore, stand alone trackers add a stamp to their setup You add stamp, and when someone send you a one liner, they get an ack and all one liners get sent to your mailbox as a msg. Should be possible.

#3 Listen to the radio, deciede when no one is hearing you (like aprs tells you "check your path, no digipeat heard") and alerts you.
Again...Im not sure...I may need to go to the single board computer for this. There is a 8088 (I think its the old V chip) single board computer thats about 6"X6". Can look into that and see what it can do.

FYI stamp chip, daughterboard, and accesories have run me about $300.00 But most of this can be trimmed down.   I think the "END USER" system should be around $125.00.

That adds quite a bit of cash to a tnc !   IF we go with a board that really has brains, price goes up even more.
What I want to see is a small screen output of pertanent info, and a small aprs display on my dash.   This is what all this play is leading to...

The UTLIMATE set up is : (for me)

APRS running on a small display like the SONY GPS system that tells you how to get from point a to point b.
OR
APRS running on a display like my fishfinder has.. Dedicated butons for XMIT POSITION, XMIT BEACON, LIST HEARD, ZOOM IN/OUT
etc......
Like the song goes "To dream the impossible dream"

Argh, dinner guests left at 0130!

FOund bug.  WIth all the testing of APRS76a and b and c, at the last
compile, I couldnt resist the temptation to change a little innocous "i"
to a "P" for POSIT in a deep subroutine...  Well, sure enuff, that
conflicted pages later with the "P" in the POWER calculations for the
Power-Height-Gain display.  Ergo, if you do a MAPS-PLOTS-POWER or
MAPS-PLOTS-DF, you will get unpredictable results, OFTEN and endless loop
lockup...

I will release 76d Sunday to fix it.  IF YOU HAVE ANY more comments about
76 a,b, or c, Lemme know ASAP.  SOrry for the trouble...

Steve --
I just received the latest Pasternack catalog, which is a "Special
Sale" catalog good through August 31. On the back cover, which is
also the order form, line 5 states that the minimum order is $25.
Additionally, for this sale take 5% off and free shipping on all
catalog items except coax, but must use the special order form.

Depending on length and cable type, prices vary from $16.61 to
$17.71 (RG174A/U, 12 inches to 72 inches). Catalog number for the
RG174 stuff is PE3672-length, where length = 12,24,36,48,60,72.

These are their "normal" prices. Take 5% off that.

They have 7 types of coax to choose from. RG188,RG174,RG316,RG58,
RG142,RG223,RG316. The last 3 are double-shielded.

Ring their bell at 714-261-1920.

Doesn't do me much good -- I've got a Garmin 38 with no ant jack.
Great software built-in, though.

Thank you, thank you, thank you Bob. No, I have never used the Mouse Digitizer.

On another subject, I checked several maps that I have converted to WGS84 at
the corner points and the center. The correction is consistent as I surmised
so changing the map origin is a valid method. It put my average GPS position
right on top of my house as opposed to the previous position 175 yards west.
I have also documented through the USGS database that the 100K and 2M data
are from maps that were drawn using the NAD27 datum as expected. I also
concluded that it is not worth changing the datum on maps made from the 2M
data so I am only going to change my maps that were generated from the 100K
data. I would suggest that any maps that are changed be documented as such
in the remarks area of the map file.

291. Florida Statewide APRS Meeting

From: n2czf@gate.net
Date: Sun, 9 Jun 1996 17:21:02 -0400
To: aprssig@tapr.org
Message-ID: <199606092121.RAA37450@osceola.gate.net>
Rendered body type: text/plain

I will like to see a show of hands as to who is interested in a APRS meeting for the state. We have enough user groups in the state now to suggest a special meeting and I have already been approached by several about some possibilities.

The feeling so far is to have 1-2 users from each area attend. These users should be the ones who are ACTIVE and COMPETENT with APRS in their area and are willing to spend some time working before and much more after the meeting.

The reason for 1-2 users and not a whole clan is not to limit activity but to make a location much easier to find to have this at right now. The aim of the meeting will be to talk about where APRS is going to go in FL, if it will go anywhere at all, and if it does how are we going to accomplish this. Time will be limited to rag chew and teach beginner's since most everyone will need to drive quite a distance so that is the reason for only 1-2 people. We have all played with APRS long enough now and with the exception of 1 or 2 areas nothing constructive has been done yet.

Those attending will then have the task of taking notes and possibly getting everyone in their area together for a local meeting, filling everyone in and start the wheels turning. If no meeting is held at least get a copy of the notes to everyone or have a net on a local repeater to talk about the subjects.

Once everything starts rolling, if it does, then we can make plans for a more general meeting, possibly at the Tampa or Melbourne Hamfest since they are popular and in the central part of the state.

NOTE: If anyone is interested in Melbourne this September LET ME KNOW ASAP. September is not to far away and I am sure that the closing date for a room request is even closer!

292. USE CD-ROM MAPS direct

From: "John W.(Bill) Hays" <billh@netins.net>
Date: Sun, 09 Jun 1996 21:23:04 +0000
To: APRS SIG <aprssig@tapr.org>
Message-ID: <31BB40B8.4266@netins.net>
Rendered body type: text/plain

I discovered a way to use the Map files direct from the Sproul Bros. CD-ROM. You thereby save an awful lot of storage space on a hard drive.

This works on a Macintosh IIvx, not sure if an equivalent approach is available for the Windows version of APRS. It is VERY slow loading the program when it gets to the "reading map files" stage. It seems to be quite satisfactory, though admittedly slower than direct from a HD, when loading the map files from within the MacAPRS program from the CD-ROM drive.

Open the Spoul Bros. CD-ROM directory and open succeeding sub-directories down to the file labeled "DCW_USA" (MAPS_01:DCW:DCW_USA) and make the alias called "DCW_USA alias". It will say, "can't do so because
file is locked,do you want to make it on the desk top" or some such statement. Do so and then drag the alias to the map folder in your hard drive where you have all the other maps for MacAPRS.
I also made an alias file, "USA_IAIL alias" from the CD-ROM subdirectory (MAPS_01:PC_MAPS:UNCOMP:USA_IAIL) of the unzipped PC-APRS files.

It is interesting to note you can not use this scheme to make an alias of the CD-ROM itself or of the next lower two or three subdirectories, however you can of the next to last subdirectory.
This approach places a heiroglyphical entry in your map listing of all the files/maps in the lowest directory and allows you to open them into a new map window on MacAPRS.

```
I hope I have not thorughly confused averyone, play with it. I'll bet
you
figure it out in spite of my "DOCS" now I know why software authors
hate writing supporting DOCS!!!!

Jim, KU0G, has posted my "Some Really Simple Basic Instructions
on Getting APRS on the air NOW!" on his KC-APRS Web site and I
think Bob may be including it in future distributions of APRS.
Nonetheless, (and excuse me if some of you think it's too soon
to post this again) I'm attaching it below as plaintext.  I'd
```

appreciate it if someone could either post it on aprssig/files
or tell me how I can do so.

____

~~~~~~

SOME REALLY SIMPLE BASIC INSTRUCTIONS ON GETTING APRS ON THE AIR NOW

Copyright (c) Arthur Booten 1996. All Rights Reserved (*)

NOTE: I have used APRS 7.5 for this example. If the version you are using is something else, substitute that something else for 75 (ie: if you've got version 9.9z, use APRS99z.) Also, if you downloaded APRS (FTP, BBS, etc) or got it from a C-D, substitute "A:" for the appropriate path.

If you don't use Windows, but have PKZIP204g, put the APRS disk into the floppy drive of your choice (I'll call it drive A) then expand the APRS files by using the following commands on the hard drive of choice. Note the use of the "-d" command to create the necessary subdirectories.

```
     Make an appropriate directory     MD APRS
     Change to this directory          CD \APRS
     Switch to the A drive             A:
     Run PKUNZIP with directories      PKUNZIP -d APRS75.zip C:
```

If you use WINZIP, change to drive A and double-click on APRS75.zip, click expand button, tell it where you want it and follow onscreen directions. If the distribution you have is on more than one floppy disc, you'll have to have PKZIP properly installed and it's location known to WINZIP.

***************** VERY IMPORTANT *****************
IF YOU ARE USING A KANTRONICS TNC, OPEN THE FILE "INITTAPR.TNC" (it's in the "SYSTEM" folder) AND, USING ANY TEXT EDITOR, CHANGE THE LINE THAT SAYS "PAR 0" TO "PAR NONE" IF IT'S A KPC-3 OR THE APPROPRIATE FIGURE FOR YOUR MODEL. IF YOU DON'T, YOUR TNC WON'T UNDERSTAND ANYTHING THE PROGRAM WILL TELL IT!!
****

Make sure your TNC is in Terminal or Command mode (whatever it's called by the manufacturer.) Go to the DOS prompt (NOT in a "DOS window",) go to your chosen APRS folder and invoke "APRS75.exe". This brings you to the LOGO screen. Enter your callsign. Tell it what kind of TNC you're using. Answer the other various questions. When you're done, the main map screen will appear.

Now press M(aplist) then C(hange), and tell it you want the appropriate maplist for your area. This will probably be either EAS(t), SE (Southeast), CEN(tral), WES(t) or NW (Northwest.) Use the arrows or mouse to bring the cursor to your approximate location (keep your eye on the upper left part of the screen which shows latitude/longitude of the cursor.) Then press HOME to center the screen on it. Use the PgDN key to zoom in a few screens and tweak the cursor to your EXACT QTH. You may have to zoom in to a very small scale to get the necessary resolution. Once the cursor is at the right spot hit the HOME key again.

Press I(nput) M(y qth) and confirm your lat/long, choose a symbol for yourself (try S(ymbol) - for starters ... it's the little house), type in a brief comment, and verify it. Once you press that "Y" you're essentially ready to go on the air! In it's most basic form, you're configured! Tune the radio to 145.79, hook it up and see what you can see. It might take a few minutes for other stations to appear (assuming there are some) but if you get a little impatient, try pressing O(perations) Q(uery) and give it a radius such as 64 to force position reports from others.
~~~~~~

Look for stations whose symbol is a star. THESE ARE THE WIDE DIGIPEATERS! Is there one fairly close to you? If there is, press the D(igipath) key. If an asterisk (*) appears next to a callsign (hopefully that nearby WIDE) then you're hearing it directly. Make a note of that nearby WIDE station's digipeater path.

Now you're going to set YOUR digipeater path. Press O(perations) D(igipeaters). If you heard that WIDE station directly, enter it's callsign and ssid, if any. Follow this with a comma, then type in "WIDE". For example: "WA2JNF-4,WIDE" would be how I'd enter it here in The Bronx, but the nearest WIDE to YOU is what YOU'RE looking for.

If you're not in range of a WIDE digipeater, look at the path used by the station closest to you, again using D(igipath). Can YOU hear this station? If so, you might try using that call as the first digipeater in your path, followed by whatever they have set for theirs. As a matter of courtesy, try to avoid this as a normal means of operation unless you have that station's permission. Few of us have rigs that can handle much more than a 40 to 50% duty cycle.

Next you want to set your Power-Height-Gain figures. Press I(nput) P(ower) and tell it how many watts you're using, your antenna's height above AVERAGE terrain (look at a topographical map of your area,) the gain in dBd and the antenna's directional pattern in degrees or 0 (zero) for an omnidirectional antenna.

Finally, set your Beacon Text by pressing Alt-B(eacon) and typing in a short comment different than the text you used for your Position Text earlier. At this point, you're about as far as you need to go for now.

APRS has extensive documentation included with every distribution. Most of these will be located in the "README" folder and can be viewed even when the program is running by pressing F1 - F(iles) and typing in the name of the file you want to see. I suggest you carefully read "HELP.TXT," "SCREEN.TXT" and "OPS.TXT" to give you an overview of the most pertinent information.

If you have access to E-mail, there is even a mail reflector you can subscribe to which will keep you up-to-date on the latest information on APRS and to which you can send your many questions. To subscribe, send a message to "listserv@tapr.org" with the subject of "subscribe". The body of the message should read "subscribe aprssig your_name" where your_name is... YOUR name!

I hope to see you all on my screen in the VERY near future. Look for me at cruise missile coordinates:
4052.69N/07354.06W.
73 de Arte / N2ZRC

(*) = But feel free to use it, distribute it, re-post it and enjoy it, as I had no intention to claim exclusive use of it. APRS isn't exactly intuitive in it's installation and setup and any help we can get out to the newbie should be welcomed.

Arte Booten <N2ZRC@gnn.com>(preferred) or <N2ZRC@aol.com>(if necessary)
(Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
[Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

Target those coordinates and fire quantum torpedoes.....

298. aprs for spotters, df'ers

From: Jeffrey Bledsoe <jbledsoe@flash.net>
Date: Sun, 9 Jun 1996 22:39:16 -0500
To: "TAPR APRS Special Interest Group" <aprssig@tapr.org>
Cc: "Mike Heskett" <mheskett@startext.net>
Message-ID: <199606100339.WAA21980@defiant.flash.net>
Rendered body type: text/plain

Hello,

I am thinking of getting into aprs to keep track of storm spotters and df'ers; I'm trying to conceptualize how I can merge aprs with our existing map; any response to the following questions is greatly appreciated.

I ceated a Skywarn map for our county one year ago.   Could an image of my map's grid system, in GIF or some other common format, be merged with aprs maps for the Macintosh?   If so, do the Mac maps have a transparent background so that my grid system could be placed behind the aprs image of our county roads........ and still be (mostly) visible?

To get a feel for my grid & numbering technique, see GIF's of my Skywarn and detailed maps at: http://www.flash.net/~jbledsoe

Thanks,

Jeff Bledsoe / N5YMV

I had to buy the Precision Mapping 2.0 at $39 to get the Beta GPS program to work. It wont work with the Precision Mappint LITE. The mapping program requires the CD-Rom to get any detail level. The GPS program ran on my Desktop PC, but since I don't have a portable CD-Rom drive, I cant test it on my laptop yet. It looks like I'd have to LAPLINK an install to my laptop to make it work there. It seems rather silly to Have a GPS program I can only get to run on my desktop.
In other words, you MUST HAVE Precision Mapping 2.0 on CD in order to get

the GPS program to run it seems at present. There's too my gyrations you have to go thru to run it from on a laptop without the use of a CD-Rom on the laptop. It will currently eat about 5+ megs of space on a HD as well.

Same place as always:
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload/

But the D version may not be there yet the directory data is June 7.

303. WINAPRS 'features'?

From: w2g3zfj@unix.asb.com (bob)
Date: Mon, 10 Jun 1996 08:45:48 -0400
To: aprssig@tapr.org
Message-ID: <199606101251.IAA15874@unix.asb.com>
Rendered body type: text/plain

Hi Folks

I've been running a registered copy of winAPRS for the last 2-3 weeks as a Gateway in Long Island (hf->vhf only) and have noticed a few 'bugettes' which I wonder if anyone else has seen.

-my Gate symbol frequently (3-4 times a day) gets changed back to the default qth symbol. It can be reset by forcing my position to be re-sent.

-when I go tracker mobile, g3zfj-9, on every occassion when I return home several of the position reports will have labels either for other stations or like times e.g. 15:23:34 etc. Last weekend I parked and left the tracker on, when I got home there was kd4uyr sitting in Oakdale! I knew Kevin wouldn't have moved from Fl!

-if I manipulate screens it will crash quite often i.e. open/close a few map windows. If I leave it alone its very stable.

Info:- Kam Plus, 80MHzdx2 clone, 8M Ram, winAPRS v1.0

Any ideas? Any timescales for next revision of winAPRS?

And how do you suggest these "1 or 2" folks be picked from the masses?
Also, could you define "areas"...

Lets see, I here by declare myself APRS (Mac of course) of area EL96UD!!!

Rich, I hope you have a smile on your face....
In all seriousness, good idea but you need a better plan.

IMHO, the VHF/UHF digital folks are a bit scared of "closed meetings"
to define a networks policies. We have other "group" here in Florida
that do a good job of irritating folks.

If you want a state "WIDE" meeting fine, but there are a lot better
ways to manage the event.

Might I suggest....
        1. Form a working group to generate a statement of objectives.
           Note, this can be done via email but, I would suggest off the SIG!
        2. Formulate a detailed agenda.
        3. Publish a the statement of objectives and the meeting agenda.
        4. Follow you detailed agenda at the meeting.

If this is just a "bull" session then I would expect your meeting to
turn into pandemonium.

Question, which I expect the working committee to define,
what are we(you) trying to achieve?

Also, who is going to enforce any resulting policies?

Rich, don't take me wrong, I think that a state APRS group meeting would
be great. It is my opinion that great thought and care should be exercised.

Don't think something has been discussed here for equations and coordinates transformation methods, but here is a shareware program that seems to do the job quite well:

available on:

http://www.connect.net/jbanta/

SeisSoft Multiple Regression Transform© v 1.0

A new Windows (3.1 & Win95/NT, 16 & 32 - bit versions) Shareware program that converts Lat/Long between various datums.

All constants from the US Defense Mapping Agency Technical Report DMA TR 8350.2 Second Edition.
Important Note: The Multiple Regression Transform is the prefered method for converting between various datums.
Unfortunatly, it is only available for converting between WGS84 and seven other datums:

Australian Geodetic Datum 1966
Australian Geodetic Datum 1984
Campo Inchauspe Datum
Corrego Alegre Datum
European Datum 1950
North American Datum 1927 (Mainland Canada)
North American Datum 1927 (Continental US)
South American Datum 1969

Where multiple regression values have not been computed, use the Molodensky Transform (See below).
...

Didn't check if the math are correct! (I would be in pain to do that anyway,:-) but the guy seems to know what he is speaking about.

The simplest method, not the best in terms of accuracy, is to input the coordinates in you GPS with NAD27 datum, switch to WGS84 and read the converted coordinates. GPS usually use the Molodensky transform method, quite easy to program.

Rendered body type: text/plain

Well, they are at it again, picking on Ham Radio for spectrum. The recent CONSIDERATION of the WRC97 committee responsible for the LEO satellites has targetted 2 meters and 440 as POSSIBLE areas on which to stick the satellites. But lets take a deep breath and think about this for a moment.

Satellites need to be small, light weight, and power efficient. Now think of the size of tuned circuits, power amplifiers, and most importantly, antennas at 144 MHz. Not very small are they? 440, though a third smaller, is still not an optimum band for a satellite service. I highly doubt they want to REALLY take 2 or 440.

Now take into consideration the MILLIONS of users on these bands worldwide. There is much more on 2 meters alone in the rest of the world than meets the eye. The ham bands are used for business in Africa as the rigs are cheap and readily available. There are legitimate hams all over the world, let alone the USA. The efforts to clean up these bands, and the resulting QRM from the users that havent heard the word will be monumental. Again, I highly doubt they really want 2 and 440.

In my humble opinion, the real intent of the LEO operators is to take a different band, perhaps 1.2 or 2.4 GHz? The attempt to grab 2 and 440 is merely a smoke screen to divert our attention away from that. The higher, almost microwave bands are much more satellite friendly and any satellite manufacturer would never consider 144 or 440 MHz.

You may ask though, why would I want to save "those microwave bands". Those higher bands are the future of ham radio. When 2, 220, 440 get filled to capacity (most will argue they already are) there is nowhere to go but up. Technology these days is such that you can get on these bands with literally ONE CHIP. If ham radio does not keep and utilize these bands, then we are already a dead issue, but thats a topic for another time.

The alterior motive is probably buried in some doccument, in a language or unit of measure not easily recognized. Would you put up a fight against the reallocation of .144 GHz? or how about the reallocation of the 7 decimeter band? Do the math.

My advice? Continue to fight the reallocation of 2 and 440, as if no one does, then they might really end up with it, and not be able to make it work (see the history books about 220 and UPS). But WATCH THEM VERY CAREFULLY!! The real intent to grab one of the higher frequency bands is there somewhere.

Rendered body type: text/plain

```
While in the process of preparing for my club's Field Day, I realized
something.  I plan to tape as much as possible of our FD effort and make it
into a few minute long presentation tape.  Why not do a similar tape on a
national scope?
```

```
So here goes, I am looking for a copy of your club's FD raw footage,
preferably this year.  I can accept most any tape standard, broadcast,
professional or consumer.  I would prefer it on one of the broadcast
formats, but I know how likely that is.  Here is what I can take...

        Digital Betacam
        D2
        Betacam SP (preferably BVW w/ ch3&4 audio)
        One Inch
        Hi-8
        Regular 8
        SVHS
        VHS (sp mode only please)

        M-II (if you must, I can find a deck)
        Stills or slides

What I wont take...

        Quadruplex
        Film (any size)
        Consumer Beta

If you have any tape you are willing to let me have, reply via email and I
will send you the shipping particulars.  And please spread this call for
tapes around as much as you can.

Thanks...

Indeed, they tell you how to load it to a specific directory. One thing you need is a CD and some form of transfer cable/program: Texas is 48 megabytes!

The GPS interface I'm working on is seperate from theirs, using their DLLs to interface to PM2.0.4

saw it, snagged it but haven't tested it. I've been a bit busy of late. I'm working on an independent version of the interface to do wome of what I want, as an independent developer.

Thanks for the note.

I'm trying to coordinate a full duplex packet pair on UHF for
1) Differential broadcast
2) local APRS use

I'll let you know where I end up. I'm planning on 1200 to start, but an eventual migration to 9600 for most of the use. DGPS data will probably be sent at both speeds: PacComm has a method using one TNC to do that, according to Gwyn!

I suspect DeLorme should watch over their shoulder. JustSoftworks uses the Tiger maps as a base. So does DeLorme. Where DeLorme wins out is that they are getting more regular updates from some states, upgrading the Tiger files on the fly. They're not reinputting this to the Gov't, as far as I know.

JSI tells me they are looking at starting to do their own map updates, as well, but still want to keep the price down. So, the catch is: The DeLorme maps may be a bit more up-to-date, but the base mapping is still the same.

Oh... did you know that you can move the maps over you your hard disk and tell PM2.0 where they are? And not carry the CDROM drive with you?

You can get PM 2.0 to run on your laptop if you transfer the state directory over to your HD. California takes up about 30 megs plus the program, but it is worth it to get street detail mapping for a lot less the deLorme. Use laplink, network card, etc. but get it there - it is certainly worth the effort.

My laptop is a 486/100 running win95 and PM 2.0 works great!!!

GPS time is reported via seconds from Start of Week (GPS).  Some of the
handheld units (and, apparently, panel mount units) are not quite as sharp in
performing this, relatively simple, calculation as others.

If you really need precise timing, check on aleph.gsfc.nasa.gov for more
information on Tom Clark, W3IWI, and his Totally Accruate Clock.  For another
approach, snag a Trimble receiver and set it to ONE SATELLITE, TIMING mode.
That should provide you, in Trimble's TSIP format, with solid timing data.  If
you need real precision you will be using the precise Pulse Per Second
output...

Hope this helps.

The mechanism Barbara is using is in the program MADTRANS.  It's not one
single delta for the whole country: It's calculated based on location.

Didn't someone post MADTRANS to the FTP site?  If not, let me know and I'll
put it there.  It's a DOS program.

I patently agree that the real intent of the LEO manufacturers "frequency
grab" is to eventually grab off space in the microwave bands.  What
really annoys me is the effort already underway to do this in th 2300 MHz
band which, really, is equally as well populated considering the satellite
occupancy as well.  In other words fellas, it ain't APPLE computer or
Motorola that wants 3456 or 5.5 GC, but rather an Industrial group that
wants to set a precedent which they have already accomplished!

Thank you's to the two individuals who responded. Others might care to
know that Kenwood's East Coast Service Center in Virginia Beach is
currently working on radios received May 16th. Cost is quoted at $50/hour.
Not sure I have much choice here. One of two choices from QST
advertisements (in a state just north of here) was NOT recommended by one
of the local CT vendors. I'll miss the HF traffic that's not GATEed to me!
Maybe by next Thanksgiving.....

It's not oftern for me, but it does crash after many window opens/closes.
It seems like a memory leak in the window close code. I'm not sure it
I'd blame WinAPRS or Windows.

FYI, I'm running it on a 486/33, Windows 3.11, 32MB RAM.

DO not be surprised if the MFJ-1278 acts in strange ways with APRS. I have tried to get APRS working with a friends 1278 and it just does not act right, many little problems, that become one BIG annoyance. I have heard this from others that have also tried the 1278 but I have also heard from some that it works fine.

That deserves one big WOW! I think this is a big asset to the many laptop users that do not have a portable CR-ROM. I have one but instead of carrying a extra brick (ROM Drive) I would rather copy the needed maps and keep the ROM in a suitcase or the back seat for later use if needed. Those darn interface cables look so cheap I am afraid of using it on the go and breaking it off the card!

That is funny, it took ICOM over 5 months to return my 2M SSB rig, the whole summer! While my TS-850S/AT only took 1 week including shipping time from NJ to VA. I have has 2 opportunities to send stuff to Kenwood and it has never taken more than 2 weeks. The ICOM problem was even more, after 5 months it still did not work and after some yelling I sent it back and finally got it fixed 3 months later!! 8 months for a stupit power supply fix!

Needless to say I have never bought ICOM again.

>
```

This is the idea give or take...

>If this is just a "bull" session then I would expect your meeting to
>turn into pandemonium.

Agreed, this is why I am asking for just a couple of people, any more than this would be pandemonium! It close to happened once before....

>Question, which I expect the working committee to define,
>what are we(you) trying to achieve?

That will be the question of the day. Note that I said to decide where if anywhere is APRS going to go in FL. The question is better stated not as what WE are trying to acheve but what can or will APRS acheve.

>
>Also, who is going to enforce any resulting policies?

I hope that this does not become a question at this moment. Problems if any at this moment will hopefully be resolved in a un-official capacity by parties involved. In all honesty who can enforce policies, no one that I know of. The only way to enforce will be to have anyone that does not agree and cannot resolve withdraw from the "project" when they get fed up. I know that I will not let my $3,000 worth of equipment sit connected 24hrs a day 7 days a week at risk of lignting and surges for a lost cause.

>73 de Dennis Mobley KT4FI
>Sunrise, FL (EL96UD)
>

I would say that we agree on most of the points even if we both look at it from different ends. My end has been from long time APRS users, many of us speak on the LL and internet quite often for long periods, I have the phone bills to prove it. Many including I are wondering where is this going ?? We have spent countless hours learning, teaching and spending $$$ for a stagnent project. Many have already taken their gates and digi's off the air since they were serving no useful purpose. Look at me, I have 3 others in the area that are active and use the GATE, is it worth $3,000 during the summer months to run the risk ?? Now if the NWS actually has a plan and has the brains to pull it off and can use the system, and more users get on and active I have a better reason to run the risk. The Tampa area has already come to this point and 2 digi's were lost and 1 GATE.

Everyone is talk and no action on a statewide basis. Some areas are moving forward while others are dead or almost dead. What we need is to find out what works and what does not and try to get everyone to try a new plan attack.

Again as far as the limit of 1-2 people let's be realistic. How many people are actually going to attend from Hillard County or Key West not to mention the Panhandle. I hope the panhandle attends, they seem to have the most together group out of everyone. As far as areas everyone knows what is a area and what is not. Broward/Dade is obvious most ove you have a active part in both counties so this is a area. Tampa is another group, Orlando is close but completely seperate and the same for Daytona and Melbourne. This is going to cost people $$$ to attend, who is willing to do it ? I tried this 2 years ago and got a bunch of crying "I ain't going here or I ain't going there" it's to far etc. etc. I said forget it, I won't even bother. Now people are telling me we got to do something about a meeting, GREAT, if this is what is wanted I am all for it.

Don't know about you but I am willing to spread the word and take $$ out of my pocket to travel if there is enough interest. I am NOT going to spend $$$ for a meeting place at some hotel somewhere so that no one shows up or so that mass mayhem breaks out. Like I said this will be a "idea session" we need people with expirience so that there are ideas or at least realistic ideas. If we have everyone showing up that will make a meeting place difficult to find and also slow everything down with "my ABC TNC will not work with version SNAFU! why?" Or "what is a UNPROTO" path.

I would like someone to take charge and plan a meeting like that not only locally but for a larger hamfest. A person can only do so much, I really do not want to take that job this time, I have already done it 3 times. SNAFU's are a big problem with any APRS type and need looking into with new users. But how is anyone going to lead a group without having a basic direction down first ? If anyone want's APRS to work we will need a group, I know that many down near you have somewhat of a problem with groups and networking but if this is the case then APRS will NEVER EVER WORK as it was intended to.

I have forwarded WA4MEJ your e-mail address.

His name is John, hope you guys get together and get a strong group going. This is what I try to do for the state and it is tough, connect people who are either active or interested and let them take it from there locally. I got dozens of people in my addres book here on internet and some are not even on internet so I try to get telephone numbers also as a backup. No one person can handle the whole state so I hope to get at least 1 person from each area that is willing to spend time and orginize local users.

Ive been working on the basic stamp thingy for a while and am burnt out on it...I just finished an article that Im submitting to QST called "Build an intellegent TNC controller"

One last idea though that Im gonna try to get on line.

Remember back when I tried to have an APRS alert triggered by a NWS alert...That didnt work because of a legal issue.

Hows this...

As most of you know, Florida has been drowned by as much as 9 inches of rain a day and severe t-storms and lightning. I have a old sensor that shuts off the computer when it detects lightning bursts.. I can basic stamp this to the tnc and vhf users can set their wx alert to say wind speed of 999. Then they will be alerted if this wind speed is sent. I can program the stamp to change the beacon text to a wx text with a wind speed of 999
(or any wx parameter that you choose that would be unlikely). Upon reciept of the lightning monitor beep it changes the wx beacon, thus alerting local APRS stations of incoming lightning...

Might be kinda fun to see if anyone is interested in this.. I once saw in QST or one of Wayne Greens mags (73 ?) about a home brew lightning sensor. Can anyone get a hold of that, I build more and everyone can play along ? Any thoughts ?

Mike

Rendered body type: text/plain

```
Here are my thoughts about a aprs get together...

#1  GREAT IDEA...we should have done this last year !!

#2 MELBOURNE...
Another great idea...good location..(plus I can run APRS HF MOBILE with my
new stamp on VHF and HF  YEAH !!  )

#3
1-2 people from each area...
Hmmph..not so thrilled...

Why not invite all concerned parties to attend, those that want to be a part
of the future system will want to be there.  Those that cant attend can make
their opinions known..Maybe we could have a subsig of just FL stations on the
internet ? Therefore all FL stations can communicate in their own sig and
work together and have a local forum to discuss local ideas and get to know
each other better ?

In any event, I like the Melbourne hamfest so I'd like to attend.  Lets not
be an exclusive club, invite all concerned parties and try to maintain some
order. Everyone can contribute...

Probably the result of having a old BTEXT permed into your TNC.  Try this:
BTEXT and type in several spaces or one or two characters.  That should clear
out the old BTEXT that DOS APRS probably wrote in on a software shutdown...

8 MB is BARE MINIMUM for running WinAPRS.  I added 1 MB and it runs fine but I
still will get an ocassional lock-up or crash due to having too many things
running at once!  It's simply a matter of having enough memory available.
Remember, WINDOWS IS A MEMORY HOG!!!  The more you have, the more you still
need!!!

Hi Bob,
   Regarding the Mic-ENc kit, any thought to including in the kit of parts
for the Mic/ENC, a small circuit designed mother or small daughter board
already designed and scribed out so all of us older folks with weak eyes, and
unsteady hands, could easyily install the parts to make the circuit.
   All we would have to do is try and solder the parts to the board, and
hopefully make it work. Many of us are not good at designing and a small
already designed printed circuit board would be very usefull and a great help.
   Maybee someone on the sig could design, develope and supply the circuit
already on a board, would help in the kit building process.
   Perhaps Clement Engineering could make it and include with the kit of
parts. ??
    For consideration. Got my kit other day, and scratching my head on
building the Mic-encoder circuit without goofin it up. Hi.. & Thanks

    73's & Enjoy, APRS, TRY IT YOU'LL LIKE IT, AND OUTSTANDING PACKET PROGRAM
                  FOR ALL...........

ASk and the Gods giveth...

If your on AOL use KEYWORD TORNADO ALLEY and look up the wx store info... I copied this for the others to read. There is a picture in the aol catolog but I cant get it...It looks like a PVC pipe with a coax on one end.

Here is the ad:

This LSU-2001 lightning sensor can detect lightning ground strikes over 200 miles away, yet it is immune to electrical and radio interference. The unit is fully assembled and completely weather-proof . It is encased in hard PVC plastic and the internal solid-state VLF receiver is encased in hard amber-like epoxy plastic. The built-in all-directional 10" long heavy copper detection antenna is unbreakable. The sensor's small cross-section makes a small target for hailstones and debris during severe weather. The unit is input, output and overload protected. Its sensing system uses a patented solid-state wideband very low frequency electrostatic transistor "crystal" radio receiver. This design allows the sensor to draw NO battery power unless lightning is detected.   The output is quasidigital, meaning that the stronger detected signals cause larger output currents. The sensor digitizes the detected lightning signals so computers and pulse counters can readily use it. Each sensor pulse represents a single lightning event or an individual part of a lightning return stroke chain. The sensor can separate lightning discharges and return strokes occurring as fast as 100th of a second apart.

To use this sensor, you must purchase additional parts at a local electronics store, such as Radio Shack. The components are inexpensive. The sensor come with easy-to-follow diagrams of nine different methods of wiring your sensor, each with a complete parts list, such as; making a pop sound as each stroke is sensed; connection to a range meter; connection to a computer; or connection to a siren type of alarm. You should have a basic knowledge of soldering. I made mine portable by using a plastic electrical box for the components and an alligator clip for ground. It makes a clicking sound anytime lightning is near. I had a lot of fun making it...and if I can do it, so can you. This is a great high-quality do-it yourself lightning kit.

The Weather Mall guarantees the unit for one full year. Made in the USA.
 Item #4426

Price: $39.95

Optional Software: Stormwise Lightning Recording System Software for PCs. It turns your computer into a powerful data logging system. It can count, graph, and print data. Recorded data has a date time stamp for each event. Recording rates of 1, 10 or 60 seconds can be selected. An automatic start recording feature can be set to start recording data to disk when a count-per minute threshold is exceeded. The software comes with an infrared serial port interface which links the software and computer to the outside world without wire connections - thus your computer is not physically connected to the lightning sensor. If the system detects a rapid rise in lightning activity common in severe storms, the computer sounds an alarm. A great addition to any home weather station or a fun way to start one.

Price: Sensor & Software $79.95

Johnny, show the folks whats behind door # 2

This next little baby is a HAND HELD !! T-STORM and lightning detector. IT looks very high tech with LED'S etc...

Here is the dope on that...

people will go through life and never see a tornado or experience a hurricane, but everyone will experience lightning. Roughly 200 people are killed by lightning each year. You may have read recently where in Texas, several boys on a high school football team were struck and killed by lightning. What you didn't know was that at nearby Rice University the coaching staff had this SkyScan lightning detector with them as the storm was approaching. The unit warned the coaches and the players were pulled off the field. The storm passed through the area and hit the high school boys.

This hand-held instrument with the electronic sophistication to detect lightning as far away as 40 miles and accurately ranges its approach, by both audible tone and four LED's which are ranged in miles (20-40, 8-20, 3-8, 0-3). This feature tells users if the storm is moving towards, away, or parallel to their position. The unit even has a severe thunderstorm mode that activated a severe storm warning light and special audible tone, alerting the user to take immediate action.

Features: SkyScan is powered by two 9 volt batteries and has a power saver mode. Range select allows the user to choose the range at which the unit will alarm. Automatic false trigger alert occurs whenever the unit detects background noise high enough to interfere with the accurate detection and ranging of lightning. The unit is contained in a rugged weather resistant plastic case with built-in belt clip. 6.5"H, 3.1"W, 1.5" D. Weighs 10.8 oz. without batteries.

I highly recommend this unit to anyone responsible for others during outdoor activities such as golf courses, outdoor sports teams, swimming pools, sailors, construction workers, or kids at a picnic. Also farmers plowing a field, golfers in Florida, and the list goes on. Comes with the makers one year guarantee which is doubled by the Weather Mall to two years. Makes a thoughtful gift.

Price: $199.00

Ok, do you guys think I should go for it ?? I can get one and see if I can interface a stamp to it.. The alert will prgram a parameter in the TNC to change one wx parameter...OR
Bob B...
Can you make a lightning or T storm alert text for aprs ?
If folks are interested in this stuff, let me know and I'll pursue it.
I can forsee a lightning alert station every few 100 miles...?
OR EVEN BETTER...
use the pager function on the new Kantronics tnc and BEEP EVERYONE about incoming bad wx ?
Im so excited I can hardly type !!

APRSdos REPLY COMMENT: Certainly. We are working on a complete new layout, but it will be months before it is in production. In the meantime, there is no need to compress the duaghter board as small as I indicated. Levae yourself plenty of room for a nice casual assembly...

Alan, I use the 1278B to run aprs here with no problems, just take a

look at the commands that are suggested, and then look and see if you have a similiar command on the 1278B. I can and will send you my config file if you think it would help..

WARNING!!! The following is advertising by direct EMail to the APRS SIG! If you are offended by this, please close this message and delete it now. No offense is taken if you exercise your inalienable right to be left alone!

If you haven't reserved one of the Blackjack GPS Antennas before now and were waiting for more to be available, the time is NOW!!! I have 8 antennas left that the people who made reservations failed to follow up with the order and payment. So, the deal is this:

Send me EMail advising of the mailing of your order and money order ($43.00 to Blackjack Antenna, 13 N.W. Barry Rd., Kansas City, MO 64155) and I'll respond by EMail of the confirmation of YOUR reservation.

COD shipment available ONLY in United States!! Canadians, sorry.....you guys need to send payment up front in U.S. funds.

If the first batch was any indication, these 8 will go FAST!!! I can't produce any more antennas or the other items I'm getting ready to release with moving the rest of these antennas...

Sounds cool, they used to advertise it in the Edmund Scientific Catalog,
but I havn't seen it in there lately.
I think ES had a lower price, go figure. $200 sounds a little steep. I'd
buy one, if, and only if, it came with a reasonable trial period. I've been
dissapointed by stuff like this in the past.   I bought Radio Shack's pocket
storm-alert weather radio a few years ago, and after trying several units,
couldn't get one to work. Oh sure they received the NWS bulletins, but
never once sounded when the 1060 HZ tone was sent. I bought a slightly
larger MAXON WX-Alert radio and it works fine. In fact, I'm probably going
to buy a new one and give the old one away. Heck, for about $1000 you can
pick up a 3M Storm Scope and see exactly where the lighning is striking!

I think we covered this before. The FCC frowns on "special event"
triggering of amateur radio transmissions. One person on this sig has fully
researched this in conjuction with using the NWS weather alert to signal
APRS stations automatically the second the alert is received. The FCC says
it's a no-no. BUT one could certainly
include lighning strike information in one's regularly sent beacon.   It may
not be as good a solution, but at least it's something.

How about a lightning strike counter?

Sounds great to me Michael. Keep us posted on this, would love to see
something like that interfaced with APRS. I have heard some talk about this a
long time ago (Before the sig i believe) on packet in the early days of aprs.
I just downloaded a demo program from a lightning tracker with a map for
florida, the demo looked great, but this setup cost $499.00 a little much i
think. The map was another $59.00 and was just a map in PCX format. Keep us
posted Michael.

This is hard to understand because why is it ok to transmit the WX info from a
Davis or peet brothers weather station, but not from a Lightning detector
receiver!. I fail to see the difference myself. Hummmm

Mike-

 A Ham Vendor was selling those lightning detector sensors (the stick with
the 9 v battery) at the Miami Hamfest.  I think he was in that low ceiling
hallway area at the back.  Maybeyou or one of your local folks picked up the
literature.   I think the 39.00 price was close, but they had a different
model too that you haven't mentioned.

When I get home from this trip (I am in Knoxville, Cookevilie, Rockwood TN
this week)  I'll see if I can dig up the info for you.

No...this is a problem that has been in MacAPRS for some time, seems to
occur very rarely, and due to bad data packets that gets sent out
occasionally from a stand-alone tracker. While using the same code as
MacAPRS got WinAPRS running fast, it also means you get to share our
bugs. KT4FI and I have told Keith about it before, seems to be a very
difficult bug to reproduce and remove. When it does happen here in South
Florida, it attracts all stations to the same point at the same
time...the last time it happened here, my Keys house, Miami house, and
KT4FI all went to 'visit' KA4OPZ. If you have a log file, I suspect Keith
would like to see it to track down the problem.

On the other hand...

My WinAPRS is running on a Win 3.1 (32 bit), 386/387, and FOUR, count 'em,
FOUR meg of ram.  It doesn't run as fast as the Pentium, but I don't need it
too.

I've left it on 24 hr/day, 7 day/wk, and the only time it's studdered was
when I tried to do something to the tnc/serial port setting without shutting
down the port first.

And on my KPC3, when I tried to change BTEXT, a space wouldn't work.  I
think the book sez a "%" will reset the text.

351. GPS and Lightening/Tornado tracking

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 11 Jun 1996 09:31:31 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960611091344.21225A-100000@arctic>
Rendered body type: text/plain

All of this discussion about storm tracking and lightening detection can be combined with the precise time output of the TAPR GPS receivers to plot the positions of lightening strikes over hundreds of miles!

The one microsecond precise time combined with a very simple LF receiver to detect strikes can make it easy to triangulate the location of each strike and plot them in real time on the APRS map. With this timing accuracy, position to about a quarter mile should be possible.

Hardware would consist of a GPS receiver, a couple of transistors for the LF lightening receiver, and a TNC/radio to report the precise time of each strike. Special APRS software would compare the strike reports and plot each one on the map...

This would give not only SKYWARN folks information on approaching storms, but would also give interested HAMS advance warning of approaching sever lightening so that protective measures can be taken for their satellite stations...

Just another application of the precise time output of the TAPR GPS receivers.. (TAPR is putting together another group purchase at $179)

I think there is a lot more to this occasional crashing business. I have
12 mb ram and after the program runs for a few days, a crash seems pretty
likely, even with just two windows open. One thing I have noticed is that
if I have five or six outstanding packets (messages), there is a
significant chance the program will crash when moving to a new window.
So....even with adequate memory and keeping the number of windows small,
the program has bugs ...as is expected. Don't expect increased memory to
ELIMINATE all crashing...the program is definitely not in that state yet.
More memory is certainly better and desirable...but...

I agree...it tends to happen with opening and closing windows a
lot...which is an important feature of the program. It will get fixed, I
am sure.

>Any thoughts ?
>
There's an article in Scientifc American, the amateur scientist column, May
96 about a Low frequency ElectroMagnetic (EM) Wave detector. The detector is
just an antenna, with some op amplification and low pass filtering. The main
purpose of the detector is to study earthquakes precursors (some scientists
reported low frequency EM activity before the Kobe earthquake), but the
antenna is actually very sensitive to lightning, and the system can be use
to monitor thunderstorms activity (look at the article for details).
As far as detecting how far a thunderstorm is, like the kit your were
speaking about, i doubt about the accuracy of the system.
For aprs a "lightning level", or "EM activity level", indicator may be nice.
By plotting this parameter on the map one could easily follow the
thunderstorm path.
Instead of adding one defined parameter to APRS wx reports, it may be better
to allow for the transmission of any user defined parameter. This is already
included in APRS, look at telemtry.txt in the readme directory.

> wnolle@ix.netcom.com

This isn't really the appropriate forum...but I'll take a whack at all
the above while wearing my ARRL OO hat.(then suggest it be carried
on in rec.amateur.policy for follow ups..)

There is a subtle difference here...and I'm going to try to explain
my understanding of the rules(and how I'd apply them to write an
appropriate OO card...)  Anyway,  you are probably all aware that
it is a bozo nono to retransmit the NWS radio stations...that is
because they are another radio service and this is forboten! On
the other hand, if a station under automatic control announces it
is 12pm..this is okay(much like announcing that my lightning sensor
went off...duck!)  This isn't a retransmission of data that
originated on another radio service, but rather from a sensor
attached to the stations computer.  This should be okay.  Go
for it.

Another corrolary event that gets brought up in this discussion is
"Why can't I have someone phone by system and have it announce THAT
on the radio..That is just another example of automatic control."
Also commonly called the "ring-back" function on some repeaters.
The league took a look at this about 4 years ago in a QST article
and explained that the cause of the signal on the air could be
a non-licensed person, thus it was also bozo nono.

Sorry for taking up the SIGs time on something that really belongs
on the .policy group..but hopefully it'll shine some light on the
issue.  If you have questions...or want to argue about it with me(which
is what happens in .policy ;-) then send me private email...please
don't polute the SIG with it...

> prove it.
>

SNIP

Rich,
First off thank you for a well written reply.

I do believe that we have the same goals and our only difference is
limitation of attendance of the APRS seminar.

To address issue you have posted...

1. " I am willing to spread the word and take $$ out of my
   pocket to travel if there is enough interest."

   We agree.

2. "..my ABC TNC will not work with version SNAFU! why?"

   Lets plan a training seminar also.

3. "My end has been from long time APRS users..."

   It is my observation that you have put the effort into
   APRS and have earned the right to a position of
   respect and authority within this field.

4. ">Also, who is going to enforce any resulting policies?"

   My point is that if enought folks engage in the
   planning seminar, any resulting "policies" would
   be easyer to enforce by peer pressure rather them
   and iron fisted authority.
   (We all know just how far that would go :-)

5. "I know that many down near you have somewhat of a problem with
   groups and networking but if this is the case then APRS will NEVER
   EVER WORK as it was intended to."

   The only answer is "yep". (the land of the WIDES)

My goals for APRS is two fold...

1. Experimentation.
2. Present another tool for the local ARES/RACES folks.
   This is my primary reason that I excepted the captain
   of the digital team for the local ARES/RACES FD96.

Rich, as I stated in the past, I will support a well thought out plan
with both effort and dollars.

I reconize your position in this endeavor and, if needed, would
be glad to assist.

To the rest of the SIG, thank you for the indulgence and bandwidth.
Rich and I can now move onto direct email.

Thank you & 73
Dennis Mobley

I am not a big Kenwood fan but just recently sent my 942 mobile in for
service, it took them 7 working days.  What they don't do is tell you it
is ready.  I finally called after 4 weeks and asked about it.  they sais
(and the paperwork agreed) that it was done weeks before.)

Thats my 2 cents.

Gerry, I can not get their dll.zip to unzip after 5 attemps.  I have
written to them that they may have a problem.  Could you re-zip their
dll's and e-mail them to me. (we also write VB 4.0 code).

I would like to see a toolbar on PMap 2.o GPS that will let you draw
```

vectors (DF lines) from the GPS blip. What would be ideal is a drop
down box that would prompt you for the degrees of heard. (bearing 48
degrees true) maybe even an alt-D shortcut to activate the drop box.

Thanks for your assistance.

Hi,

I received my GPS-20 yesterday. I see what the other fellow meant about the
connector, tiny!

I was wondering if anyone has any ideas about a box to put this into? The
box would also need to have some room for the 12V -> 5V reg.

So, if anyone has any good box suggestion, please pass them along.

Hi Bob, There seems to be a bug in APRS. Was there in version 76..and also in
76c. I am using a Kam+ and we had the same problem in version 70 I think it

```
was. It happens when someone connects to your mailbox and leaves you  mail it
also shows up on your read screen. Also if you go into O+C+T and talk to your
tnc you get a  "|A" at the beginning of your command line and also may get it
anywhere when your tnc shows the command. Hope that helps

```
I uploaded waypoints into the Garmin 45 and they all
went onto the WAYPOINT list just as expected.

BUT no matter what I did, they would not show up on the map.

After giving up, I turned off the GPS and when I came back later and
powered the GPS back on again, NOW all the waypoints DO show on the map!

Called GARMIN Tech Service, and the guy reluctantly fired up his PC
and got the SAME RESULTS!  He said "well, your right.  You will have to
toggle the power"...

I encouraged him to persue this back to the softwtare engineeers and make
sure that he and I were not just doing something wrong.  Im not sure if
he thinks it is that important.  But it is very important to me.  Maybe
we have to send some kind of "STORE" command after uploading waypoints
that tells the GARMIN to "activate" these new points.

Has anyone else figured this one out?

Good luck Farrell...it's my considered opinion that virtually nothing
runs successfully using Windoze 95.  Spent 4 hours the other night
configuring a modem to run under 95, which is billed as
auto-configuring/plug 'n play.  I don't think so!

73,
Gary

Here is an idea, if you can wait a few weeks.

PacComm is gearing up to produce WB4APR's Mic Encoder (which will likely be available via TAPR). We've decided to add mounting points for the GPS-20 so someone can mount the GPS receiver in the same case if they like.

Fringe benefits: You will also be able to use the Mic Encoder circuit board as a GPS-20 carrier/support board, and mount it in the same case. We'll provide physical support, RS-232 conversion, power regulation, etc. Final case should be about 1.25 x 3 x 4 inches. Rather larger than the GPS-20, but leaves space for the Mic Encoder controls etc. Case is typical PacComm extruded aluminum with stamped end panels.

I really should be running this by TAPR first, but don't you to make your decision without knowing of this alternative.

I put mine in a Rat Shack project box (blue plastic) it just fits w/
standoffs...
also got the M.I.M. in the same box...makes a nice installation mount gps
w/ the ant connector toward the box and there is enough room to drill a hole
for the
mcx connector to pop thru. I'm sending mine in a balloon package Sat 15June
(weather permiting).

APRS on 145.79;cwid on 146.565;35mm camera
Launching from western WV abt 8:00 AM

> How about a lightning strike counter?

How about a special symbol for lightning strike.  If there is an
impending lightning strike it would key APRS to change the station symbol
and send out immediate and frequent position reports ... this would show
any stations in range of the digis that there was a storm.  In conjuntion
with this you could have an alarm set based on either the lightning
strike counter or the lightning strike symbol so it beeps up a storm
(pardon the pun) at the receiving stations.

***snip***

I think this is great, not only from a APRS prespective but also from a station
point of view. A stamp local to the station could control some switching
circuits that can then control a large solenoid or coaxial relays. NOTHING will
prevent damage from a direct hit except for manual disconnects as we know. A
close hit problem can be prevented with the little isolation a relay will
provide. It is not much but every little bit helps.

Maybe if Bob includes a range subroutine in APRS the TRW alerts could be limited
to a certain area. I often see reports from KD4UYR both on HF and VHF and he is
over 100 miles away. I am not very interested in that distance for TRW alerts
but with some work with the stamp and the APRS program we may be able to assign
a interested radius of alert.

BTW you say old sensor, we all have old neat things in our box but how simple
would it be to duplicate your sensor or a likeness that would work. not everyone
will have the parts you do.

Good work Mike!

Here is an idea, if you can wait a few weeks.

PacComm is gearing up to produce WB4APR's Mic Encoder (which will likely be
available via TAPR). We've decided to add mounting points for the GPS-20 so
someone can mount the GPS receiver in the same case if they like.

Fringe benefits: You will also be able to use the Mic Encoder circuit board
as a GPS-20 carrier/support board, and mount it in the same case. We'll
provide physical support, RS-232 conversion, power regulation, etc.  Final
case should be about 1.25 x 3 x 4 inches. Rather larger than the GPS-20,
```

but leaves space for the Mic Encoder controls etc. Case is typical PacComm extruded aluminum with stamped end panels.

I really should be running this by TAPR first, but don't you to make your decision without knowing of this alternative.

Yep! I messed up (the cleaner words) I am sorry for the long drawn out message.
The previous message I sent was intended as personal mail to Dennis and some
others that I have e-mail addresses for, not to the whole sig! As many know when
you hit reply, thinking that the mail was originally personal but actually went
to the sig it goes back to the sig not the sender! Wish that the server could be
changed to actually send the reply to the sender, not the sig.

See  97.113 (e)   Just so the folks don't get any wrong ideas
 about what is the Rule.  Read it, boil it down and see if this is
what it says.....

97.113 (e)  Says that it is forboten to retransmit the Rolling Stones
or John's Wrecker Service OR the State Police BUT it is okay to
retransmit the NOAA Weather Service  ( Gov't supplied - 162Mhz)
as an incident of normal Amateur Communications.

>On the  other hand, if a station under automatic control announces it is
> 12pm..this is okay(much like announcing that my lightning sensor

That would be Telemetery. Telemetery is OK per 97.111 (b-7). . .

I am NOT a Lawyer BUT it is pretty black and white.  I got the rules
from http://www.afn.org/~gars/fcc/p97-b.html.

Whats say you try another message to the APRSSIG.   This time tell it
like it is.
```

Here is what we have learend with a months worth of experience since Dayton
about the operation of the APRS Mic-Encoder:

1) It appears that a minimum of about 100 ms is required for many TNC's
to sync up to the very short packets.  Actually about 60 was the minimum,
with a KPC-3, but we are using 100 to be sure.  Let us know your experience?

2) When you use MIC100.exe to program the MIC, you will probably need to
first issue the MODE MIC command.  This software can also configure a
MIM, so be sure it is in MIC mode before you program all the parameters.

3) Occassionally the MIC will loose its configuration.  This is obvious,
since it will power up with the LED ON.  If so, then you will have to
reprogram it.

4) In version 1.00 if you switch AUTO OFF, then not even PTT packets will
be transmitted.  So set your AUTO TIME period to off using MIC100.exe
if you do not want AUTO packets generated...

>>

This is incorrect...The FCC objected to using NWS alerts to trigger HAM
stations..This is not responding to NWS alert it is responding just like a wx
monitor... THerefore it is totally legal

Last msg re :legality of lightning reporting

Ive read the discussion for and against.

#1  Reverse autopatch...NONO
Intitated by a non ham...

Not applicable

#2
NWS alert..
Not applicable,
Im not REBROADCASTING anything.. Im not taking a nws alert and changing it.
Im doing a wx alert myself.

It's just as legal to xmit wx data as it is to broadcast lightning data.
Im not rebraodcasting anything..
Therefore work will procede with this device...

I enjoy the discussion that others have written about this project and the
```

response is overwhelming. Further I want to complement everyone for remaining civil about the difference of opnion. Even though I may not agree with everyone I respect a guy that presents his case sanely and without "name calling".

I am most interested in discussion the idea of lightning triangulation but already have started thinking about wiring my roanoke doppler to 4 vlf devices (why I dont know, just thought it would be fun)

I'll do that later...Right now I want to get the device operational and plan on giving several away (please dont ask for one) for testing. I will get these on line and compare notes then will make them available when they are running well...

After I get several more made, and distibuted locally and get the thing to talk to aprs we will procede.

I guess next step is triangulate stuff...But again, thats jumping ahead.
I guestimate that 3 users will have the completed units in a week and we can report the success of the device.

Any other suggestions are appreciated and any references on building a better VLF reciever is also appreciated..
Mike

381. TAPR GPS-20 help requested

From: stanzepa@usa.nai.net (stan horzepa)
Date: Tue, 11 Jun 1996 20:30:07 -0400
To: aprssig@tapr.org
Message-ID: <v01510101ade3ba8f7940@[206.98.48.249]>
Rendered body type: text/plain

Hello All,

Let me preface this by saying that I am a GPS greenhorn. I've never before had seen one in the flesh until I received my GPS-20 from TAPR yesterday. Problem is that the unit I received appears to be data dead.

I am very confident that the unit is wired properly and I do see +5 volts dc at the center pin of the antenna connector, so I know it is getting power, however, I get no data out of the unit. I did swap power supplies as the documentation suggested, but still no go.

My thought is that the unit is DOA, but before I reach that drastic conclusion, I thought I asked the SIG for any ideas on the matter.

Thanks in advance,

Stan, WA1LOU

I have been thinking again...How about an interface a siesmograph (sp ?) to aprs...Interesting application..? A network of stations ??

Hmmm lightning, weather, siemographs, how about those of you who live near Nuclear
power plants...?   You can buy a gieger counter with rs232 interface for $200.00. Then hook those up to aprs and issue radiation beacons..
(I didnt say alerts for that one)

When that accidental release of steam comes over the house..well..
Could be neat for documentation..

The list is growing and Im groaning...Hmm Will sleep on it again and think up some more applications...Im trying to eliminate the basic stamp now. The little baby costs $100.00   I want cheap, accurate and easy to build..
If I can do it with hardware that would be better...

I also hope to hear from Bob about what would be better, stand alone units with preprogrammed texts or something interfaced to the program and computer.

The detector just flips it on and the beacon, beacon time , and etc are preprogrammed. This would be the cheapest way..

Guys...(and gals)   please keep me posted if you have any good vlf articles about lightning sensors..I did get the SCI AMERICAN article that was mentioned (FROM AOL !) and found it ehh ok...

Im looking for the easy cheap way to build a sensor . I have ordered one though from the weather guys and will take it from there...
(did I say reverse engineer ?)

I have sent in to Kenwood over the past 2 years at least 10 radios. The turnaround has been at most 4 weeks. The radios were sent to the Virginia Beach branch called Kenwood Service Center East.

The fastest turnaround was an HT that was shipped out on Friday and returned to me the following Friday!

Have only sent 1 radio to ICOM for repair and that took about 4 weeks as well.

>Davis or peet brothers weather station, but not from a Lightning detector
>receiver!. I fail to see the difference myself. Hummmm
>

Yes, it's OK to transmit the info, but I think that there is a difference here. If you want timely information that an electrical storm is approaching, the logical choice is to have the APRS station report automatically as soon as lightning is detected. BUT as we have been told the FCC frowns on this. So the information could be included in regular beacons as long as the event doesn't cause a transmission.   This may lead to an unacceptable delay in notification.

The ad copy for the LSU-2001 states that it can detect lightning 40 miles away. Suppose you're beaconing wx info every 15 minutes. Suppose that lightning strikes right after a beacon, that leaves about 15 minutes before any notification to the APRS net. A storm can travel quite far in 15 minutes.

All-in-all I think it's a great idea. How useful it is remains to be seen. I've wanted a lightning detector ever since I knew one existed. (and that's been a long time)

Although here in Metro Phoenix we get little (if any) rain and our electrical storms are pretty wimpy. Down near Tucson it's another story, though. I wish we'd get SOME rain soon, so they'd open up the National Forests again.

Although, I've chastised others on this sig for promoting commercial products and services, I'm gonna do it myself.

There are reasonably priced commercial lignting monitors out there. In fact, a 3M Storm Scope may be cheaper and more accurate that a home-brewed system. These amazing little contraptions can reliably pinpoint a lightning strike over 100 miles away. I only point this out because we are dealing with people's lives.

Unfortunately, a lot of this information USED to be available on the internet, such as a 15 minute nationwide precipitation map and lightning stike map. They have been removed from the public domain because taxpaying netizens (who paid for the systems) dared actually to use the web sites. Oh sure, you can get them still, but with a suitable (read many hours or days) delay.

I wanted to differentiate TORNADO warning systems from
LIGHTNING warning systems..

Lightning systems use VLF recievers to detect same

Tornado systems use sound warning systems

Here is an ad I copied FYI on TORNADO systems..
So far we got rain, wind, temp, baro, lightning, siesmograph and
now TORNADO warning..

Here is the ad...Im getting started, lots to do, when we get them operating
will contact everyone with the results...
Mike
KD4EMI@AOL.COM
-------------------------------------TORNADO SYSTEM------------------
-Many tornado victims never receive a warning. The first notice they get, especially at night, is the view of the sky they see as their roof disappears into the darkness. A sophisticated electronic device now offers life-saving technology. Dr. Henry Bass, Director of The National Center for Physical Acoustics, along with associates at the University of Mississippi, invested more than 16 years in research and development to produce the Tornado Alert System (TAS).

A TAS unit has a remote sensor which mounts to the exterior of the building. The sensor receives and processes data, detecting the sound signature of a tornado. When a certain frequency is matched, the exterior sensor sends a signal to the receiver inside the building. This unit is similar in appearance and size to a smoke detector. A high db alarm will sound and provide up to 90 seconds warning for you to implement your emergency plan. Alert time varies with the size of the tornado. Tornadoes can move very quickly and 90 seconds can mean the difference between life and death or serious injury. This amount of notice will only be effective if you and your family have already planned and rehearsed actions that you would take in the event of a tornado.

The interior unit is mounted inside in a convenient location. It operates on AC power with a battery backup. The exterior sensor is mounted outside and contains the acoustic sensor used to listen for tornadoes. 50 feet of cable is provided to connect the two units.   The unit comes with a test audio tape so that you can be sure it is working effectively.

If you own a home or business, especially a mobile home, or are responsible for group gatherings in tornado country, then you would be wise to invest in this added measure of security.

I am not sure how effective this thing is but maybe someone wants to play with it...

Okay, as it pertains to APRS, we had a user who didn't want to retransmit the NWS bulletins, he only wanted to have the APRS net notified immediately when his WX-alert radio received an alarm. This could be done quite simply. We were also told that automobile trackers set off by burglers are forbidden. In both cases because an unusual event broadcast is triggered by a non-ham. (excuse me for being flippant) I doubt that lightning has a valid ham license.

We were read chapter and verse, that such special event triggering is a bozo-no-no. The information could however be sent in a regularly scheduled beacon or in a polled transmitter.

I could be wrong, but I see no difference in the two.

Is it me, or is there a very short collective memory in this sig?

Again, a neat idea, but it could be construed as a special event trigger.

The only other problem I can see with this is that a large and persistant T-storm could easily overwhelm
the entire APRS net if every lighnting strike were noted and transmitted.

Hi Bob, There seems to be a bug in APRS. Was there in version 76..and also in 76c. I am using a Kam+ and we had the same problem in version 70 I think it was. It happens when someone connects to your mailbox and leaves you mail it also shows up on your read screen. Also if you go into O+C+T and talk to your tnc you get a "|A" at the beginning of your command line and also may get it anywhere when your tnc shows the command. Hope that helps

You CAN put the Street Atlas USA maps on a hard drive BUT it is all or nothing and you will need a 3/4 Gig unit.

The new JAZ removable cartridge drives are 1.0 gig.

I decided to just add a Panasonic KXL-D742 4X CD-ROM unit to my Mac 540c. They even supply the correct direct connect SCSI cable.

My thought... Put all the neat features in; then let those who hold the license decide on whether (!) or not to use them.

Remember, APRS could easily wind up being used on commercial frequencies, where there is no such "frowning upon".

[FWIW - NEVER ask the FCC if something is OK. Do you think a Comissioner will risk his/her pension on what could be considered a judgement call?

May want to watch this.  We had lots of trouble with the Motorola Oncore GPS
boards being RF sensitive when left in their plastic box.  The metal encased
ones are great, the plastic seem to die when near other transmitters.  They
come back when taken to a less hostie RF environment.   I realize that the
unit is a different one and that Garmin's GPS is plastic too, but I just
thought I'd relate my experience.

Again, this sounds neat, but how effective is it? I'd hate to be the product testor. I grew up in Ohio and spent more than one occasion with my head between my knees in school because of tornado(es). They were readily heard over a mile away, even in large brick buildings and interior rooms. Once we were plunged into darkness when a tornado ripped up the power lines outside our high school and there were no emergency lights in many interior classrooms (a violation of life-safety codes). Tornadoes really do sound like freight trains...really big freight trains. I don't see how this product would give you any more advanced notice than that. Perhaps if you were sleeping or hearing impaired it might be useful. In most places I think a RS or Maxon WX-alert radio is probably the best choice, and at $40 or less a bargain.

Another time I had the pleasure of being on an AMTRAK train bound for Chicago when a tornado ripped-up the tracks outside of Valparaiso, Indiana just ahead of us.

Twice in Arizona I've been caught in microbursts. The 1st time I was in a 12 foot kayak on Lake Pleasant. I thought I was a dead man. If the wind didn't kill me, I thought the lightning would. This microburst destroyed a nearby school!

The 2nd time I was in my convertible LeBaron (with the top down) when a microburst lead by several lightning strikes came right at me. Lightning struck a utility pole at about 51st Ave (Glendale, AZ) just as the wind hit, causing a domino effect, toppling every utility pole on the north side of Northern Ave east to about 43rd Avenue. I had just turned onto Northern when it happened and I watched the high voltage utility poles come down one by one, each making a huge shower of sparks, as they came toward me. There was nothing to do but duck and cover. Fortunately, the utility poles came down AWAY from the street, otherwise I wouldn't be typing this. To make a long story short only one car in my condo complex was crushed by a utility pole, we lost several trees in the complex, it took SRP four days to restore partial power to our neighborhood, and we made the national news. Several people in our condo complex swear it was a tornado, some swore it was a UFO or other paranormal activity (I'm not kidding about that!), but I rode it out. It was a classic microburst. I can see why these things knock aircraft out of the sky. Nothing like a little 100 mph downdraft to ruin your evening.

As a humorous aside, after it happened there were several cars at 47th Ave and Northern that had power lines come down on them. I jumped out of my car to render assistance and to try and stop cars from driving under partially downed power lines! I can not believe how many ignorant people there are out there, as I watched several people deliberately drive their cars under power lines that were at windshield height, despite my warnings. Nothing like the thrill of wondering whether that guy dragging the power line over his roof and antenna will fry himself... Anyway I jumped out of my car with HT in hand and forgetting about the Glock holstered to my hip. I couldn't figure out why so many people, including emergency personnel, thought I was a police officer! (g) I guess a radio, a gun, and a flat-top could be a fooler.

BTW, lighting kills more people in the US every year than tornadoes and hurricanes combined, according to the NWS. I'm told the most destructive weather disturbance is "el nino." I wonder if they make a detector for that? (g)

Anyway, APRS is a useful addition to public safety. CAP uses it here in Arizona, and I'd like to see more weather related APRS stuff here. We did have one auto-wx APRS station run by Jerry Wyatt (I forget his call) who is also in the Civil Air Patrol, but I havn't seen it up lately. I just wish I had a house so I could implement a few of these things. I'm afraid to ask our Condo's Board of Directors for a rooftop antenna and wx station. They may say yes, and then I'd really be in trouble :)

>where there is no such "frowning upon".

Agreed.  I have three AR-1200 commercial TNC's.  I wish that just one of the
people who told me they are using them for amateur radio and amateur APRS
would explain to me how to mod them for the correct mark and space tones.
Two people on this SIG who promised me such info have both failed to respond
to my queries since.  And I bought the units based on their assurances.
Thanks a bunch.  Anyway, as an interesting aside, these TNC's were used in a
Burger King in California as part of their drive-thru ordering system.
Anyone want to buy them?

>
>[FWIW - NEVER ask the FCC if something is OK.  Do you think a Comissioner

```

My first GPS was a Magellan 5000, the built in antenna was not removable. To use an external antenna, you had to buy a $300 system that included the antenna with preamp built in, and a box that amplified the signal further and transmitted it to a mount next to the built in antenna. Unfortunately the high amplification factor resulted in overloading and burnout from 440 MHz signals...there was no low pass filter in the box. So it sat, forlorn, in my junk box...

Now for the cool part...besides having room for the GPS-20, the box includes a 5 volt regulator with heat sink, a power LED, the ciruitry to put 5v on the antenna line and dc isolate the receiver, and a cable for the serial port out! A perfect case for this application.

The ciruitry you would use is pretty obvious. The only complex part senses current drain from the GPS to turn on the rest of the box, I just jumpered this out of the loop. It works great, and I don't have to worry about the current drain of the external antenna killing my GPS-20.

Obviously not worth paying $300 for new, but worth looking around at marine electronic stores for dead ones, maybe even calling Magellan for one...anyone know someone at Magellan?

But the real bottom line is the FCC doesn't inforce flagrant violations involving jamming, obscenity, and unlicensed operation. Do you really thing they are going to split hairs on a subject like this? If they were to send out a NAL to someone for something as trivial as this, a letter of reply with stating why you thought it would be within the rules, an apology, and a promise never to do it again would get you off the hook. The perfect example is the over-zealous FCC Engineer who sent NAL's to the BBS operators automatically passing a commercial message. Yes, there was some angst involved, but none of them were fined or lost their licenses.

There will always be different interpretations of the rules, that's what we have lawyers for...of course, they write the rules and laws so obtuse as to require their services!

I say do what you feel is within the bounds of the rules, don't allow those self-appointed lawyers among us to slow the development of APRS!

Neat Ideas!!! Not to sure about Earth quakes and Nuclear destruction, but
since we (you and I)
live on the lightning highway of the world the lightning detector idea
sounds great!!!!!

The store where I work (BOAT/U.S.) sells a device called "SkyScan
Lightning/Storm Detector"
which (as advertised) will warn of strikes in 20-40,8-20,3-8, and 0-3 mile
ranges, each marked by an appropriate LED.  You can program an audible alarm
for the range you want etc.

Though this might be of interest.  I will activate a unit at the store (as a
demo unit) and let you know how it works.

Keep up the GOOD THOUGHTS!!!

Bud (WB4LTF)

> Right on Stve Hi, i have a Magellan NAV500DX and the silly looking egg type
external antenna. I now discarded that and am runng the receiver setting on
my pickup dashboard and it works just as good there. Don't expect to much
help from Magellan tough!. When i first installed the Egg antenna and run
the rg58 coax into the cab of my truck i must have pinched and shorted the
coax and burned something up in the preamp box. I called Magellan and they
stated as follows " To repair it will not cost as much as a new one
would". I didn't feel that was to good an answer so i opened the well
sealed box to set out to fix the problem. I found a burned choke and called
Magellan back to asked them for either a schematic (No way) or the value of
the part (No way at first), but after much talking he gave me the part
value, i replaced the 10 cent part and it worked ok after that. So don't
expect to much out of Magellan!!!. By the way mine is in the junk box also

Right Steve, again all those on the sig bringing up all those messages and
trying to figure out if it's according to the rules. Again i say if that would
be ilegal so would be beaconing all the weather station data onto aprs
give it up and let's just go for it.

Bob Bruninga said GPS20 was very RF tolerant...I'll find out!! The gps will
be <12"
from a 2watt HT. I'm using lots of shielding on the RF parts, but the gps is
in plastic... it works fine on the bench w/ everything clip-corded together!

Also, if you were at Dayton, Bob had his tracker in the same Radio Shack
enclosure.

You don't say enough to be really helpful, but ...

I assume you have 5V and ground correctly applied to the "connector from Hell".

What pin are you getting data from? How are you looking at the data? What
data speed? What other connections have you made to the 12 pin connector?

You should see data as soon as 5V is applied, even without an antenna.

> >>

> This is incorrect...

Maybe.  However...

> The FCC objected to using NWS alerts to trigger HAM
> stations..

Actually, their objection was *much* more general than that.  Details
below.

>This is not responding to NWS alert it is responding just like a wx
> monitor... THerefore it is totally legal

This is *certainly* incorrect, since a wx monitor does not *respond* to
anything,
but rather continuously monitors something and sends out periodic
reports.  The
periodic reports from an APRS wx monitor are the same under blue skies
and in
a hurricane, except for the data they contain. Unlike the system you
proposed,
the transmissions are **not** triggered by severe wx.

A system that continously monitors something and sends out data on its
subject
is a telemetry station, specifically allowed by Part 97 to be under
"automatic control."
A "lightning monitor" would certainly be legal, then - but that's *not*
something
triggered by lightning - it's something that continuously sends out
lightning reports
on a prearranged schedule.

The FCC does not agree that a system that monitors something, sending out
nothing
at all until some specific event (like lightning) happens, then sending
out data on the
triggering event, constitutes "automatic operation" according to their
definition.  I certainly
disagree with the FCC on this matter, but that *is* what their lawyers
have publicly
stated previously; I see no reason to believe that their position has
changed.  The original
intent for this was, I believe, to discourage the use of ham radio for
burglar alarms.

Something that is *triggered* by severe wx, rather than by a ham turning
it on,
is frowned on by the FCC.  It may or may not be legal, but it's very
different
from a wx monitor - this is a wx-triggered transmission, right?
Completely
different.

I think you should *most certainly* keep developing this project, and at
the same
time submit a formal request to the FCC that they issue a ruling
specifically permitting
this use.

Yep... I was taught something new after the above post via private email.
No arguement.  The ONLY fly in the ointment is the previso further down
in 97.113 that says that it can be a regular event, i.e. rebroadcasting
the NWS every Tuesday night on the net, or grabbing the latest weather
via a re-broadcast on the hour.  See...OO's are just other hams, no more
or less...we ain't perfect!

Summary...it is OKAY to rebroadcast NWS specifically in a non-regular
fashion.

>

> Whats say you try another message to the APRSSIG.   This time tell it
> like it is.

You already did a fine job of that.

My whole point to the post was that I didn't think there was ANY problem
with the sensor causing the transmission of data in the first place...
The NWS aspect was meant for illustration(which I DID screw up...)
The lightning sensor idea should be just fine...calling this sensor
telemetry also makes good sense, and IS allowed.  So now we return
you to your normal discussions of APRS PLEASE!

I REALLY didn't mean for this to tie up the sig so heavily...Sorry
folks.

Hi Mark and the group. Indeed your stories are real and applicable
regarding tornados and other disasters. In California of course,
the great fear is earthquakes. There appears to be many preliminary
warning methods some of which might be placed on APRS effectively.
Last months Scientific American has a rather detailed construction
article on an electromagnic detector for such phenonmenon. The Mu
metal rods ARE expensive ($70 each!) but do work. Winding 50000
turns of number 38 wire remains a task tho. Since earthquakes have
a finite travel time it looks like some real contribution can be made
by APRS. What do you think? Cliff Buttschardt W6HDO/K7RR

Hi...

The plug, connectors, and wires that came with the GARMIN 20 are so small I
can hardly see them.

Where can I BUY a cable for it?

Where do I get the software to run it with my laptop?

Please advise. Thanks.

>for the range you want etc.

N0PBS the Infinitely Idea-Endowed speaks... ;-)

I thought I'd make this one long message and save some bandwidth.

1) Lightning Detection... it would be nice to have some sort of way of
collaborating time, range, and stroke counts into the standard beacon.  This
would get rid of the clutter of every single lightning strike during a
standard thunderstorm showing up on a map, causing the frequency to saturate
and APRS stations to crash with a lack of memory, and would also keep the
FCC moderately happier.

Ergo, I propose something along the lines of a new parameter doohickey on
the beacon line.  It would look something like:

L000-010-014-029-048-057-082-103

The first one is 0-3 mile range strikes in the last 15 minutes.  The second
is 0-3 mile range strikes in the last 1 hour.  The third is 3-8 mile range
in last 15 min, fourth is 3-8 in last hour, and so forth for 8-20 and 20-40
mile range.

The indicator isn't quite in standard APRS format (adjust it accordingly
please ;-), and it's a bit long, but it could be used.  It also goes along
with the standard beacon, so the FCC should like it.  Maybe Zeus should get
a ham radio license ;-)

2) Internet Wormholing... when I fired up WinAPRS for the first time a week
or two ago (not on-air though -- my external antenna got in a war with a
tree last year and I haven't had time to fix it :-/), the first thing I
thought was... "this would make a kick-bum Winsock application."  :-)  DOS
isn't the right environment for IP networking (trust me, I've tried it), but
Win95 and (believe it or not) the Macintosh are.  I'm willing to work out a
nice networking protocol for APRS data.  Some issues include:

Authentification/Cracking prevention
Flood protection
Ability to gracefully handle losses of network connectivity
Ability to have a central dispersion point for connection information
Ability to handle point-to-point or broadcast-type links

The last 2 are what I think are neat.  There could be a central server
somewhere which would take position reports from Internet gateway stations,
and send them off to other gateways.  Maybe this would be a good time to
register aprs.com and aprs.net with InterNIC?  ;-)

It would be *really* nice to be able to use APRS without the metal roof
getting in the way ;-)

Bob?  Keith?  Mark?  Ideas?  :-)  -rt
```

Message-ID: <31BEC53A.7B35@dgp.toronto.edu>
Rendered body type: text/plain

Is it not true, that those who want to, can monitor NWS transmissions
and take appropiate cover as they deem necesary?

Why do we want to generate QRM as 300 APRS stations receive the same
NWS warning and commence beaconing identical NWS info?

Certainly those that truly need the NWS info will be receiving it directly?
(such as radio and TV stations)

Won't they also use a more reliable reception method than Amateur Radio?
(such as modem dial up links, internet, or a dedicated NWS receiver)

Do you really believe that a TV station, whose FCC license may mandate a
crawl insertion with NWS bulletin info, will depend on Tom's home ham radio
setup being up, operational, and updated with the NWS bulletin? Not likely!

Please remember this is AMATEUR radio. We are not a self appointed pseudo
government organization. Our traffic can deal with details of an experimantal
nature. We are prohibited from carrying commercial traffic, whether we charge
for it or not. Enjoy ham radio for what it is, not for what it isn't!

APRSdos REPLY COMMENT: I said that? Hummh....   No, I have no basis one
way or the other. Mine works, but I have no idea how much better it would
work in a metal enclosure, nor whether it is susceptible to RFI. I do know
that the GPS-45 we had on the dashboard next to a 15 year old MFJ TNC and
a 5 year old magellan NEVER got a fix unless we got it more than 4 feet or
more from the dash. The 45 did work in the backseat! (plastic roof).

>I received my GPS-20 yesterday. I see what the other fellow meant about the
>connector, tiny!
>
>I was wondering if anyone has any ideas about a box to put this into? The
>box would also need to have some room for the 12V -> 5V reg.

I used a Rad Shack box for mine. It's one with the black plastic case and
aluminum lid. I chose the one that's a bit bigger than the smallest one.
I used RS's 10mm standoffs to mount the GPS-20 to the alum. lid - widthwise
is a near perfect fit. Lengthwise there's just a little bit of breathing
room for the connector and stuff.

On the plastic box I mounted a DB9 for data in/out and power (and built an
adapter cable that breaks out power and RS232. I mounted the 5V regulator
inside the box, but discovered it gets pretty toasty, so I'll be adding
a heat sink of some sort on the screw that goes through the plastic case
holding the regulator. I also have a power lite (LED) and a 1pps LED on the
case, and a BNC connector.

The depth of the box is sufficient that the coax coming out of the GPS-20
board can make a 90 deg bend without undue trauma to anything. I was able
to solder the cable to the inside of the BNC, then coil the excess cable up
inside the box. That way I've still got plenty of "revision length" on the
cable.

```
Once completed, I can remove the lid w/GPS-20 and unplug the connector, thus
easily freeing the GPS-20/lid from the rest of the box.

I agree. Rich/Dennis, let's not close up and restrict this discussion
before it even starts. As long as it's congenial and positive, open
discussion can reap the benefits of input from the broadest base of
users, and I doubt that many users of the sig will mind the bandwidth.

Hello All,

I feel that I have to jump on the bandwagon once again. In response to
VE3DIB's statement, I would like to say Ham Radio plays a very important
part in Severe Wx Warning. I am sure Aprs and Winaprs will be a good tool to
help us out.. I am not sure about SKYWARN but I do know that our CANWARN
system would not be at all possible without AMATEUR RADIO. We are the eyes
of the SEVERE WX branch of ENVIRONMENT CANADA.We are the ones that operate
the Canwarn
nets when severe wx approaches. Look at how many repeaters we use. So you
see Amateur Radio plays a very important role in severe wx and I am looking
forward to using Aprs and Winaprs in this very important field.

I am waiting with eagerness to see where aprs and winaprs will take us..
Take care all and 73............

Make sure you have a ground hooked up. I had problems reading data
from my Garmin 45 with just the serial out hooked up. Make sure you hook
the DC ground to signal ground (pin 1?) on the RS232 cable to the terminal.

Rest assured Lew, we will not close the discussion up totally on the sig but I do not want to go overboard either. There has been talk of starting a sig or some other medium like a sig just for Florida users or anyone else interested in our APRS area but it is difficult. We need a provider who would donate the space and services for our effort to keep everyone who is interested in touch. We do not want to limit anyone to join but I also do not want to bombard mailboxes across the world with news of interest to Florida only.

For the time being I will post messages RE:Florida on the sig and request anyone with ideas or comments to reply. Just use good judgement if it should go to the sig or the original sender on a case by case basis. Some of my personal replies will go on for 2-3 pages and I will not subject everyone on the sig to that, I do personal replies and if warrented I will CC: anyone else that may be interested.

REQUEST: Anyone have a contact in Florida in the Internet business that could possibly support us with a little space for a Web page and a sig or newsgroup? Please let me know, I think we could return the favor with some good publicity.

I could write a lenghty reply to this message, but i won't except that i'm in a
heavy weather area (Tornado belt) and i have seen it many times that those great
TV stations where knocked off the air by mass power outages. It would be great to
see pull up my APRS screen and see some indication of what's going on, since many
hams including myself do have portable setups in cases such as that.

I freaked out when I watched my computer d/l all the messages about
tornado's, earthquakes, radiation and legal issues.. I can't  believe the
interest this has recieved.

I just wanted to thank everyone for their support.  I wanted to say
publically that this effort (lightning and siesmograph) interfacing will
recieve my highest priority.  As the poster at Apple computer stated
```

```
"REAL ARTISTS DELIVER PRODUCT"   or something like that.

I'll get this thing working , and will let everyone know about it.

BTW  the lightning sensor will not be set up to trigger after every strike,
cause this would completely saturate the vhf net.  I will set it up to trip
at a certain level. (What level Im not sure yet..that will be determined)

Once I get the NEW one built and working will start hiting up people to test
them and start hitting up on  BOB B  to help us out on the best way to do
this..

Will keep everyone posted.

Howdy folks...

I hope everyone is gearing up for FD.  Members of the Scranton Pocono
Amateur Radio Klub will once again participate in FD.  This year we will
be using APRS to compliment our VHF/Packet station.

I am curious if there is anyone reading this message who can confirm
activity in the above mentioned areas ON 145.790 MHz.  Locally, around
Scranton, PA, lives K3CSG-5 who will be receiving a Comet GP-6 to replace
the 4 element beam that is in use. Hams 'round here are able to enjoy
APRS stations from SEPA,NNJ,SNJ,CT,and NLI, but everything else seems
like a black hole.

Please email info back DIRECT and NOT TO THE SIG.

This is a very good idea. If it is at all possible I would like to get a copy of this to show at our field day. I don't know if we have anything on file or not, but I will look and will send it in.

Thanks,
Eddie Horton, KC5FPK
Vice President, Northwestern State University Amateur Radio Club

OK Bob, I spent 3 hours doing a net search today and here is the information. You can walk over to the Academy library and get the DMA TR (technical report) 8350.2 and 8358.2. Its a 40 mile drive to a technical library for me.

ABRIDGED MOLODENSKY FORMULAE
CONVERSION FROM AGD66 OR AGD84 TO WGS84

Reference: "Department of Defense World Geodetic System 1984
---------- Its definition and relationship with local geodetic systems"
            DMA Technical Report 8350.2, 30 September 1987

INTRODUCTION

Limited tests have shown that this method of conversion, when used with the DMA supplied parameters, may give a latitude/longitude result with an accuracy of the order of 5 to 10 metres, and a transformed height with an accuracy of about 10 to 20 metres. The formulae transform the ellipsoidal height - if the ANS N value is neglected, an additional error of the order of 20 metres may be introduced.

More thorough testing is required to verify these accuracy estimates.

DEFINITIONS:

DLAT	correction to AGD latitude to give WGS84 latitude (secs)
DLON	correction to AGD longitude to give WGS84 longitude (secs)
DHT	correction to ANS ellipsoidal height to give WGS84 ellipsoidal height (m)
DX	origin shift along the X axis (m)
DY	origin shift along the Y axis (m)
DZ	origin shift along the Z axis (m)
A	AGD ellipsoid (ANS) semi-major axis (m)
F	AGD ellipsoid (ANS) flattening
DA	Change in ellipsoid semi-major axis (ANS to WGS84) (m)
DF	Change in ellipsoid flattening (ANS to WGS84)

The Australian National Spheroid (ANS) is the best fitting ellipsoid adopted for use with the Australian Geodetic Datum (AGD)

N Value	Is the separation, along the plumb line, between the ellipsoid and the geoid. For the ANS, as used with the AGD, this N value reaches a maximum value of about 20 metres.
E2	AGD ellipsoid (ANS) first eccentricity
RN	Radius of curvature in the prime vertical (m)
RM	Radius of curvature in the meridian (m)
LAT	AGD latitude (south negative)
LON	AGD longitude (east positive)

Symbols

*	multiply
**	raise to the power of (e.g. 3**2 = 3 squared = 9)
/	divide

PARAMETERS (AGD to WGS84):

	AGD66	AGD84
	^^^^^	^^^^^
A	6378160 m	6378160 m
1/F	298.25	298.25

```
DX                  -133                   -134
DY                   -48                    -48
DZ                   148                    149

DA                   -23                    -23
DF                  -0.000000081204        -0.000000081204

FORMULAE:
---------

E2     = 2*F - F*F

RN     = A / (1 -E2 * SIN(LAT)**2)**0.5

RM     = A(1 -E2) / (1 - E2*(SIN(LAT))**2)**1.5

DLAT   = (-DX * SIN(LAT) * COS(LON) - DY * SIN(LAT) * SIN(LON)
          + DZ * COS(LAT) + (A*DF + F*DA) * SIN(2*LAT)) / (RM * SIN(1 SECOND))

DLON   = (-DX * SIN(LON) + DY * COS(LON)) / (RN * COS(LAT) * SIN(1 SECOND))

DHT    = DX * COS(LAT) * COS(LON) + DY * COS(LAT) * SIN(LON)
         + DZ * SIN(LAT) + (A * DF + F * DA) * (SIN(LAT))**2 - DA

LATITUDE (WGS84)  =  LATITUDE(AGD) + DLAT

LONGITUDE (WGS84) = LONGITUDE(AGD) + DLON

ELLIPSOIDAL HEIGHT(ANS) = MSL HT + N VALUE(ANS)

ELLIPSOIDAL HT (WGS84) = ELLIPSOIDAL HEIGHT (ANS) + DHT
```

Substitute the NAD parameters for the AGD parameters.
USE THE MATH COPROCESSOR AND DOUBLE PRECISION!

ANNOUNCEMENT
============

The following announcement is excerpt from a DMA catalog,
dated October, 1992:

WORLD GEODETIC SYSTEM 1984 (WGS 84)

A revised edition of the DMA Technical Report 8350.2 WGS 84 is now available from DMA. DoD users should refer to the General Information, Ordering Procedures, and Crisis Support Section of this Bulletin for instructions on how to receive this report.

The DoD World Geodetic System 1984 (WGS 84) - Its Definitions and Relationships with Local Geodetic Systems (DMA Technical Report 8350.2), Edition 2, dated 1 September 1991, defines the WGS 84 and is now available. It provides the most accurate geodetic and gravitational data and local datum transformation constants and formulas for transforming different datums into WGS 84. Included with the report is the DMA MApping Datum TRANsformation (MADTRAN) software program for datum transformation and coordinate conversions. Provided on a 5 1/4 inch floppy disc (double density), the MADTRAN program is IBM PC compatible. It allows input from geodetic, Universal Transverse Mercator (UTM), or the Military Grid Reference System (MGRS) coordinates. Over 100 datums are available for transformation to or from WGS 84. Output is automatically presented as geodetic, UTM, and MGRS coordinates. The report is normally used by systems developers and by persons involved in large quantities of datum transformations and coordinate conversions. The public sale price is $30.00 (available from U.S. Geological Survey).

The DMA Stock Number is: DMATR83502WGS84.

HOW TO ORDER
============

This report is available to the public, through the U.S. Geological Survey. (U.S. government procurements should be addressed to the Defense Mapping Agency directly.) Orders must be written and prepaid. To order, write to:

U.S. Geological Survey
Box 25286
Denver Federal Center
Denver, CO 80225

and ask for World Geodetic System 1984,
stock number DMATR83502WGS84
price $30
(no charge for shipping in the U.S.;
outside the U.S. add 25% for first class postage)

For further information, call the U.S. Geological Survey at (303) 236-7477 and ask for customer service.

I ran into a unique situation and couldn't find the 'easy solution'
in the readme files... maybe someone can point me to the correct file or
tell me that it can't be done....

        i was plotting the position of a helo using manual input of the
audio report data. i attempted to update the position and could not figure
out how to change the position data via the numeric keypad. it seems that
the only way is to carefully maneuver the cursor into the correct position
and 'move' the object to the cursor. am i missing something?

Bob, just a short followup to my previous message. At first glance, the Molodensky transform equations look like they can be easily handled by a 3 dimensional rotation matrix in spherical coordinates followed by a translation matrix. If so, that would be the way to go for numerical calculation.

Ron, I just got my GPS-20 this afternoon and was ready to give up with data out...but alas, it works! I'm using the NMEA output from pin 8 and feeding the KD6PBH GPS display from J Goldberg. It took about two hours for me to finally get useable data out because I didn't have an adequate antenna on the unit to get enough satellites to rebuild the almanac. I finally put a female RCA connector on the coax end, adapted that to a BNC female and hooked up my Garmin mag-mount antenna. I set the unit out in the yard and it took about 25 minutes to update the almanac. Now it will work pretty well with just a short piece of wire in the antenna jack...however not nearly as well as with the Garmin mag-mount antenna. I'll wait for your reply to the last persons questions before I add more to this follow-up.

435. Second Run of Blackjack Antennas and SPM switches!

From: ku0g@sprynet.com
Date: Wed, 12 Jun 1996 20:23:39 -0700
To: aprssig@tapr.org
Message-ID: <199606130323.UAA13323@m1.sprynet.com>
Rendered body type: text/plain

I am now taking reservations for the second run of Blackjack Antennas! The first 25 are GONE! (If you sent me EMail today or yesterday, YES, you ARE getting one of the first run, panic not!)

Lessons learned from the first run....
I'm not covering my shipping charges with the present $4.00 per antenna...
Holding antennas for reservations for more than ten days is not a good idea...
Shipping COD means that I have to wait for as much as three weeks before UPS

gets the money to me...

So, to that end I am making a few changes to my business policies, to wit:

If you reserve a unit I assume that you have already placed a payment in the mail when you EMail the confirmation to me. If a payment doesn't arrive within 8 days then the reservation will be dropped and a unit will be shipped when available (most cases the next day)...

The pricing on the antennas from this point forward will work like this: 1-4 units for $40.00 each, 5-9 for 37.00 each, 10+ for $35.00 each. Shipping/handling will begin at $5.00 with $1.00 for each additional antenna ordered.

NOW FOR A BIG ANNOUNCEMENT!!!!!!

After much experimenting and testing, I have developed a WEATHER-PROOF VERSION OF THE BLACKJACK! It's called "The Natural" and the price is $49.00 (up to 10 units) and $46.00 for quantities of 11 and up! These units are scheduled for delivery to me the week of June 20th. Send your order now and take a $4.00 ADVANCE RESERVATION DISCOUNT!

I am also ready to take orders for the SinglePortMode switch! The regular price for these units will be $19.00 but the price is $16.00 per unit (no quantity discount!) through the end of June!!! The SPM Switch comes with a three-foot serial cable and velcro attachments to allow remote mounting of the SPM switch in a location that will allow the driver to get a GPS fix without having to take his/her eyes off the road!!! No reservation necessary as these units are available now!!!

Hi fellows,

Has anyone tried to overlay realtime nexrad on (or under ?) aprs? I'm just considering getting into aprs, so I know the answer might be intuitively obvious to aprs users. I'm also trying to figure out if I can place my own homemade grid system below an aprs map.

Thanks,

Jeff, N5YMV

Check and see what your BText is. If it is Btext {/} you will get a dot after your tnc sends out a beacon. It should show up
on APRS screens as a truck until you get a beacon however.

On Jun 12, 1996 12:37:13, 'Greg Blair <siggraph@dgp.toronto.edu>' wrote:

>Is it not true, that those who want to, can monitor NWS transmissions
>and take appropriate cover as they deem necessary?
COMMENT: I know that the Pueblo Weather rely on the Skywarn before
generating most of these transmissions.
>
>Why do we want to generate QRM as 300 APRS stations receive the same
>NWS warning and commence beaconing identical NWS info?
COMMENT: I don't think that we have 300 APRS active stations here in
Colorado Springs area. But, I agree that we don't even need the few that we
have beaconing the same report (unless a station has a different coverage).

>
>Certainly those that truly need the NWS info will be receiving it
directly?
>(such as radio and TV stations)
COMMENT: The radio and TV stations take their lead from the NWS and as I
said before the NWS rely on the local Skywarn.
>
>Won't they also use a more reliable reception method than Amateur Radio?
>(such as modems dial up links, internet, or a dedicated NWS receiver)
COMMENT: I use my modems to download weather data so that I can provide a
noon severe weather update for skywarn. That is when I can get through to
the server and when the server isn't having problems. The same goes for the
internet. Their are times that I can't connect to a certain URL because
either the server is busy or is down. Thank goodness that these problems
don't happen to often. But, usually when they do is when I need information
the most.
>
>Do you really believe that a TV station, whose FCC license may mandate a

440. Antenna suggestions ?

From: Ben-Shalom Assi <4x6em@techunix.technion.ac.il>
Date: Thu, 13 Jun 1996 09:25:54 +0300 (IDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.93.960613092214.26128B-100000@techunix.technion.ac.il>
Rendered body type: text/plain

Hi All,
Just recieved my GPS-20 yesterday wired it and fired it up.
To all of you that didnt wire it yet a word of caution, the
12 pin connector is hard to wire, if you use too much solder
it will clog the hole.
Now to my question, I wired a 1/4 Lambda wire like the doc suggested,

and could not get a fix although the gps MNEA stated it had a couple
of satellites in view.
Any suggestions of a good homebrew antenna ?
bye, Assi 4Z7ABA

>Well Jeff don't think Nexrad would be possible, but grid overlays are. I
just finished doing the county i live in. What i did was made a map and
did an overlay on the map of a gridwork that corresponds to a mapbook
available for our area. Each grid is exactly the size of a page in the
mapbook and are numbered the same as the grid in the book. The reason for
this is that when foxhunting we can tell those people that are not
running APRS (But are using the mapbook) at what page and sector of that
page to look for the fox. I have used this in the past and worked out
just great. By the way most foxhunters here use the mapbook.

446. WinAPRS Icons Changing

From: Truman Boerkoel <truxenia@erinet.com>
Date: Thu, 13 Jun 1996 09:36:51 -0400
To: aprssig@tapr.org
Message-ID: <1.5.4.32.19960613133651.00666918@erinet.com>
Rendered body type: text/plain

One of our locals run his GPS as -15 (from DosAPRS) and shows up
on the WinAPRS as a Van. The Icon will change to a House and at
times will switch back to a Van only to change back to a House.
(Strange to see a House running through the streets of Xenia, Ohio).

I switched back to the DosAPRS and the normal Van Icon shows up.
Has anyone else seen this or is it a Bug in the 1.0 release?

> and 'move' the object to the cursor. am i missing something?

APRSdos REPLY COMMENT:  Good point.  THe INPUT-ADD command allows you to
keyboard in a new LAT/LONG when you add a new object to the screen, but
to HOOK and INSert (move) an existing object, you can only move the cursor
to the location and hit INSert key.

Here is a convoluted way:
  1)  Use INPUT-ADD to re-enter the HELO at the new location
  2)  Hook and DELETE the old position..

> Now to my question, I wired a 1/4 Lambda wire like the doc suggested,
> and could not get a fix although the gps MNEA stated it had a couple
> of satellites in view.

APRSdos REPLY COMMENT:  Actually my 1/4 wavelength vertical wire stuck in
the antenna jack, assumes a decent groundplane.  For the bare minimum, I
soldered two 1/4 wave radials on the edge of the board neares the connector.

I DO NOT RECOMMEND THIS.  But it did work.  THe better way to use just a
1/4 wave vertical, is to mount the GPS unit on the back of a piece of
ground plane material (copper PC board) and use a piece of 1/8 inch brass
tubing to serve to connect the ground plane to the Antenna connector
SHIELD.  THen insert your 1/4 wave whip through the ground plane into the
tiny antenna jack...

I refrained myself to answer this subject for a while, but here I have to
say something. There is nothing personal against anybody  in this answer,
just my point of view, open to discussion.

There is NO (I repeat NO, NONE, NADA, AUCUN) warning method that works with
any degree of confidence to predict an earthquake (I should say: to answer
the questions: when? and where? precisely enough. I can predict that
earthquakes will occur along the US pacific cost in the next 10 millions years).

This doesn't mean we will not find a way in the future, nor that some
precursors do not exist in some cases. Just that there is actually nothing
reliable enough to be widely used.
This is a highly sensible topic, for people living in concerned areas, so,
please, do not start thinking of using some pseudo scientific warnings
spread over radio networks if there is no reasonable scientific basis.

When we send weather data over APRS , we do not send any warning, but raw
data. This is up to the people looking at them to interpret the data. I
think this has to be the same for lightning, radioactivity level, or
anything else: APRS transports the data, but not the warning. Besides, that
should eliminate any concern about FCC rules.

>Last months Scientific American has a rather detailed construction

>turns of number 38 wire remains a task tho.  Since earthquakes have
>a finite travel time it looks like some real contribution can be made
>by APRS.  What do you think?

Read carefully the paper, they warn the reader about the credibility amateur
scientist networks need if they want to be recognized. Low frequency
electromagnetic waves can be generated by other phenomenon than earthquakes
(thunderstorms for example). The real contribution is for a lot of people to
build the device, record continuously data for long periods,and send them
for analysis, not to send unverified warnings each time they see something
strange (this would discredit the work of the whole network).
That doesn't restrict us of sending the data over the air, and playing with
the idea of localizing the origin, mapping the path of the phenomenon
creating this activity (and if this a thunderstorm, great). This is where
aprs, and the capability of real time positioning analysis, is unique.

By the way while you look at the pile of Scientific American at the library,
there is another article about a cheap, but good quality, homebrew
seismometer. It uses 3 ADXL05, which are accelerometers in a chip from
analog device (application note available on their web site), cost is less
than 30$ a piece.
You are not going to do any prediction with that however: a seismic wave is
generated as the result of an earthquake.

The is to let anyone who is interested know that the Florida APRS Web page is
well on it's way now. MY ADDRESS WILL BE CHANGING TO  n2czf@magg.net

The magg net account has been started and my account under n2czf@gate.net will
close on July 8th with no mail forwarding provided. Cybergate could not even let
me pay for a shell account for a few months so I can forward my mail!

I will start the Web page this weekend and let everyone know what the address is
once it is up. I have also been given the OK to start a FLAPRS Sig from one
person and have a maybe from another. I will wait a while on this so we can
decide which way will be best before we go ahead and do it. Many have said that
they still want to hear about FL activity (while I only got 1 nasty gram) on the
sig but I agree that any long conversations just about FL should not be here on
the APRSig. I know that I will continue as normal on here but anything drawn out
just FL will probably go on that sig so FL users see it and do not miss on the
replies. If anyone else want's to be included they can either sign up on the sig
or let me know and I will forward specific messages privately.

Hey Les,

Thanks for the APRS ref. I printed it out and placed it on my operating table. No fumbling around now.

73, George KD4FJ.

Comments well noted. However, keep in mind that we are a BACKUP to the "regular" emergency services, which have a tendency of falling apart all too often.

Our strength is in our numbers. If, for example, the HF rig at the Pittsburgh National Red Cross building dies (which happened), they don't have a spare. The call goes out, and they have 3 or 4 replacement rigs there within the hour.

We run SKYWARN to supplement the NWS spotters. If their phones go dead, then WE are the spotters. Period.

Keep in mind that one of the main reasons for the Amateur Radio Service to exist at all is to provide a backup means of communication in the event of emergency.

If you don't want to use a particular feature, then don't use it. That's well within your rights as a license holder.

However, I'm all for adding features, even if they can't be legally used under normal conditions. If I'm running in an emergency situation, I do what I need to get the job done, then answer questions later. That's why I mod all of my radios for out of band coverage.

To the programmers: Please put in all the neat, potentially useful features that you want. Just be sure to give us a way to turn them "off".

The data format Steve is talking about is a Radar Coded Message.  There is a
program that takes these messages and will convert them for display, BUT the
output is only in 5 levels.

We have access to it here in Kansas City from both the Kansas City and Topeka
NEXRAD sites which is distributed via packet bbs by the NWS itself.  So, it's
possible to get it IF you can convince some ham at your local NWS Office to make
it available to you!!!

I would be hesitant to put this type of object out on APRS due to the amount of
data generated, BUT if your NWS office leaves all of the information intact in
the RCM then you WILL get wind speeds, inflow/outflow, rotational vortices and
vertical profiler data which could be a HOOT to have available!!!

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

How about making it user-settable?

How about TWO alert levels?  Roughly, "There is a storm coming" and "This storm is
getting NASTY".

Just a thought...

Hello to the Bob and the group,

I was wandering Bob,what was in the plans for APRS with the new

EAS (Emergency Alert System)around the corner.

Are the two systems compatible?? Would an EAS received message

allow for a watch or warning box to be drawn no the APRS map??

Broadcasters,Civil Defence,Emergency Management,etc..are currently

in the planning process for this new system.

I have not heard much out of the Amateur Community as yet on this

topic.

In order to get the Developer's stuff to unzip you need to give them a call and complete a straightforward agreement regarding development. Doesn't make them the owner of anything you develop, especially if developed for non-profit "stuff" but it's something to keep their lawyers' retainers happy, I think.

The folks there (I seem to routinely talk to someone named Steve) are friendly and willing to help, or admit ignorance if they don't know the answer.

Ken, why don't you drop me mail directly (gerry@cs.tamu.edu, n5jxs@tamu.edu, or gerry@rsgis3.tamu.edu) and we can discuss more.

I have been able to convince Davis Instruments to release their Programmer's Reference Disk at NO CHARGE. The information is available either from their LLBBS (510- 293-3546) or their internet address (http://www.davisnet.com

Davis is now committed to Amateur radio, and is proving it by this FREE OFFER. There is only VERY LIMITED personal support, since they are offering it FREE, so do not expect to get unlimited phone support from them.

I hope that this is helpful to anyone who wants to "tinker" with interfaces. I have been able to put together a complete comparison of the Davis Weather system and the Peet Brothers Ultimeter system. I will try and get it out to the SIG over the weekend, so that an informed decision can be reached, if you are considering the purchase of a weather system.

Hope to see all of you "On the Map".

>the questions: when? and where? precisely enough. I can predict that
>earthquakes will occur along the US pacific cost in the next 10 millions
>years).
---Snip-------------

Let me rephrase that...

The monitor will be able to provide hobby types with that data and it might be of interest thats it..

There is no notion -none---zero-nada----to PREDICT repeat PREDICT these events...

It's just a way to provide data out to the radio group if someone was interested in it.. Just like we can watch the news and get the rainfall, temp or log into the internet and get GEOS maps...

It is not intented to act as anything more than an interesting way for people to play around...

The lighning detector does have some warning applications but again, its all just for the hobby...

Mark: Add to your BUG LIST for MacAPRS 2.4.1:  Some stations appear as an H
inside a grey circle. Sam, KO6JR, who runs MacAPRS appears this way on both
his mobile GPS signals as well as his home station.
WB6HIO (not running MacAPRS), just a few miles from Sam, also appears as an
H. I have also seen Hs in Solano and Santa Cruz Co.  Supposedly Sam wrote
to you about this roughly a month ago.  No one has reported ME with an H
symbol. This problem DID NOT start with the initial use of 2.4.1 suggesting
that it may be caused by some change in the digipeter's function.

I've never heard of EAS - is it the same as SAME - the Specific Area
Message Encoder that NOAA is beginning to install at its weather radio
stations?

There's been a discussion of SAME on the ham-wx mailing list.

i will be using the convoluted way, but not just because of the
speed and accuracy of getting the data into the program, but also because i
can then see the 'track'.
        it's interesting to note that you can have several (well, i tried
only two) objects with the same 'callsign' without crashing the program.
nice bulletproofing, bob!

What we're talking about here is NEXRAD RMC data product's. These are ASCII files of about
60K bytes that contain coarse NEXRAD product's. These product's can be any of the NEXRAD
product's like rain, wind, and whatever else NEXRAD can see.
The RMC data product's must be produced by the NWS people and then made available. There is some
software on the ARRL BBS that creates the base maps for your computer for the NWS location
you select, you can then transfer by whatever means the RMC dataset's and display them as overlay's
to the maps the NWS NEXRAD RMC program created on your PC.

It all depends on how many sources you want dumping the same information
into the network.  EAS will carry the same information as the WX service
bulletins, (which also carry lat/long for watch/warning boxes BTW!).

The key to EAS will be the ability (eventually) to turn on radios and
TV's upon receipt of the message, and the ability to warn areas as small
as individual zip codes, without warning half a state.  Of course you can
alert the entire country if needed, and authorized at the national level.

All cable companies and broadcasters should be on line by mid 1997, but
the planning process is going slowly in many areas.

I just ran across some cool shareware s/w that may have an aprs application.
It is "HyperSnap" available on many web sites (Tucows and others). What it
can do is to grap a snapshot of all or part of your screen every x seconds
(you define x up to a very large number) and automatically store the picture
with incrementing file names. So... one could arrange it to capture an aprs
screen once or twice per day for later viewing. Beware, in auto capture
mode, HyperSnap dissapears from the screen and does its thing. If you forget
about it and have the settings turned very high, it may fill up your hard drive!

The Radar Coded Message product is just that...encoded. There is freeware available to decode and display the image on a PC. The NWS AFOS pill header includes the middle three letters of RCM. For example: MIARCMAMX is the radar coded message for the Miami Doppler. Sadly, the product is NOT available on the NWS "wire" now delivered by GTE via satellite (formerly Contel). We're working with the Miami WSFO to try to get NWS to change that policy. For now, as KU0G indicated the other day, you must make some special arrangement with your local WX office to get the product.

Displaying decoded doppler data on an APRS screen MAY be a serious bandwidth hog, even though the RCM's are only around 2.5-3K generally.
Would be interested in seeing it, if it can be done!

473. simultaneous winaprs&JNOS

From: ko6xs@ko6xs.ampr.org
Date: Fri, 14 Jun 96 07:31:07 PDT
To: aprssig@tapr.org
Message-ID: <712@ko6xs.ampr.org>
Rendered body type: text/plain

I was wondering if the following is possible:
I run a 24hr bbs w/ JNOS running under windows on 486sx connected to a
dual port tnc (Kantronics 9612). A Kenwood 733a runs 9600 baud on 440 band
and a Yaes ft5100 runs 1200 baud on 2m. Now, thee's not much traffic on the
2m freq. I an set the Yaesu to switch back and forth between the bbs 2m
freq. and the aprs 2m freq, pausing for any traffic.
$64 question: Is it possible to route the correct information, each to
its own program: aprs info to winaprs, and bbs info to JNOS? Or is it
possible to configure windows so that both programs get both information
and then each recognizes its own??
Thanks for your help.

Lots of stuff from Mr. Christensen removed here -----

Comments well noted. However, keep in mind that we are a BACKUP to the
"regular" emergency services, which have a tendency of falling apart all
too often.

This is absolutely the best discussion and comment of the whole issue I've seen
here - let's all copy, print, and refer to it regularly and move on to getting
it done!

I don't have the DCC proceedings in front of me, but I recall the presentation talked about one of the automatically generated highly compressed formats that was only a couple of K in size. It was automatically injected into the ascii stream coming out from the NWS.

477. GPS ant. pre-amp offer.

From: Bernard Seront <seront@seism1.ess.sunysb.edu>
Date: Fri, 14 Jun 1996 01:27:20 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960614052720.0075faac@seism1.ess.sunysb.edu>
Rendered body type: text/plain

I was looking for a pre-amp ship for my home made GPS antenna for a while, and found something interesting:

The MAR-6 from Mini-Circuits is the perfect candidate for that.

For those who don't know:

It's a monolithic ampl, DC to 2GHz, typ. gain is 16 dB @ 1 GHz, 11 dB @ 2 GHz, min. gain @ 2 GHz is 9 dB over the full temperature range (-20 to 85 °C). Power supply is 3.5 V and it draws 16 mA. RF input and output provide a good 50 ohms match.
The power supply and gain seem to be exactly what Garmin recommends (According to a post in the sat-nav newsgroup: max current 15 mA, max RF gain 12 dB).

The case is either a small signal RF transistor look-alike package with 4 leads, or a SMT (surface mount) package.

The DC power is supplied to the ship through the RF output via a (required) bias resistor. All you need to build the amp is the MAR-6, 2 capa (100pF chip), a resistor (~90-100 ohms) and an optional RF choke or ferrite bead.

The basic circuit for GPS application with 5 V DC supplied through the coax is:

```
MAR-6  1 In, 2 Out        +---R----+
       4,3 to Gnd.        |        |
                     4|  RFC       |
                    |\|   |        |
 (Ant) RF in---C1---| \---+---C2---+-- RF out (to gps)
                   1| /2
                    |/|
                     3|
```

If you don't have 5V on the coax, you connect R to an external power source instead of folding it back to RF out.
There was an article in 73' (Dec 1992) about the MAR series, with a PCB layout (actually, all you need is 50 ohms striplines for RF in and out, i'll make a drawing).

So what: I eventually got an answer from Mini-Circuits, and got a good price on the MAR-6 (here at the university we participate in their Partner Program), but I have to buy 50 of them minimum (min order is 50$).

So here is the deal: if there is enough people interested I make a group purchase and distribute them to everyone interested for cost + shipping + epsilon for my burden.

* Your cost is going to be 2$ a piece, everything included.

Note: I am not doing that as a business, I am not going to do that again.
Bare price (for me) is 1.06$ (+.05 if SMT) each + tax + shipping.
I'll have to buy an envelope and a stamp for each order (I'll send them by first class mail unless there are good reasons not to).
Usual price from Mini-Circuits is ~1.5$ each.
If you think my offer is unfair or, if you want to buy a lot of them, see directly with Mini-circuit.

If you are interested: send me a **personal** e-mail (seront@seism1.ess.sunysb.edu),

!if you just reply to this msg it's not going to be personal!

Please put "MAR-6" somewhere in the subject, for easier sorting.

Indicates the quantity your want, and if you want SMT or not (I can order both types to fill the 50 units requirement).

DO NOT send any money now, if there is enough interest, I'll have to confirm the order and the details with Mini-Circuits first. Note that they quoted 1-3 weeks for delivery. If everything is ok, I'll ask you to send me the money (check, bill in an envelope if you feel comfortable with that, or any other easy way for me, but NO COD) and you got your ships in return.

Disclaimer: If there is any technical discussion needed, we should do that -before- I order. I never tried these amps, I do not -guarantee- they'll work. If you burn your GPS because of the preamp don't come back to me, I won't take any responsibility for that.
FYI: I spoke with a tech at Mini-circuit yesterday, and he recommended the MAR-6 for GPS applications, he said it is often used for that. As far as I can tell there shouldn't be any problem.

Bernard, KB2TGH.

NO, it is not possible to get 2 programs to both talk to the same port. It is possible to create a virtual com port that does the splitting, you have to be a very good low level driver software person to do this. The answer is the same for Mac and for Windows.

480. Weather Syatem Compairison

From: "Alan K. Unangst" <alanwc7r@primenet.com>
Date: Fri, 14 Jun 1996 12:35:10 -0600
To: aprssig@tapr.org

Cc: bruninga@nadn.navy.mil
Message-ID: <2.2.32.19960614183510.0067d35c@mailhost.primenet.com>
Rendered body type: text/plain

I will start out by saying that I have NO proprietary, personal or financial interest in either of the weather systems that I am going to compare. This is an attempt to answer the questions that I have received concerning the Differences between the Davis Instruments Weather Monitor system and the Peet Brother's Ulitmeter system.
What follows is FACT not advertising hype or sales PR. Both systems are good and have their strengths and limitations. I am not interested in return hate mail or being FLAMED for this article, it is only intended to give a point by point comparison of the two (2) systems, which you prefer, or buy is entirely up to you. I DON'T CARE!!! I hope that it will allow the interested end user to make an informed decision before he/she plunks down money for a weather system. Also, both systems interface with APRS\WinAPRS and are fine for Skywarn & NWS applications.

So here we go:

	Davis Weather Monitor II	Peet's Ulitmeter 2000
Display:	4.38" x 1.88"	3.25" x 1.5"
	3 items displayed	1 + 1 items displayed
	1 hr. interval Barometric trend change	3 hr. Barometric trend change
Accuracy:	Both are equal	
Price:		
Console	$395.00	$379.00
Ext. Temp/Hum sensor	125.00	110.00
Inside Hum. sensor	Included	100.00
Rain Collector (0/.01")	75.00	90.00
Data Logger	Included	No*
Data Logger/Software	165.00	69.00
Duplex Cable	n/a	9.00
	________	________
Total Package Price	$760.00	$757.00

Heated Anemometer	no	(upgrade) yes
Weather talker	yes	no
* Requires Dedicated Computer	no	yes
NASA Ambassador Program Approved	yes	no
High/Lows	yes	yes
Accessories	19	11
Phone modem adapter	yes	no
Wireless rain gauge	no	yes

Here you have the basic comparison. A complete, detailed report is available. Just send me a SESE and I'll send it to you. (1431 Haisley Ct. Prescott, Az. 86303-6395)

I hope that this answers many of the questions that you may have concerning the two (2) systems. As stated before both are good, and have strengths and limitation, this "goodie" or "that". I do not think that you can go wrong with either system, it is what your personal preference is...does it do what you want it to do for what you are willing to pay, do you like the looks and feel of it etc.

We need as many Amateurs on the air with APRS\WinAPRS transmitting the current weather conditions. it is not important which system is giving the data, only that it is being given.

Look forward to seeing you all "On The Map"

_______________>

There is an even more profound difference, as the various flavors of NOS want to see KISS frames from the TNC. The TNC does very little processing of the frames, leaving virtually all of the AX25 protocol handshaking and upper layer (TCP/IP) protocol processing to the NOS software itself. APRS on the other hand, requires that the AX25 protocol processing be done by the TNC and the info passed out the port to APRS as an ascii string from which most of the AX25 control info has been stripped. Not only would you have to have a port splitter, but one of the data paths would require a packet-processing driver that looks like a tnc in convers mode to APRS.

There's a fella over in Alabama running AutoWX. He is about to drive our net crazy by outputting erroneous info setting off our WX alarms.

When the alarms go off, he is showing 9.99 inches of rain. Is there something he should be doing, or a different version of AutoWX he should be running? I think I remember the Author is here on the SIG. Or is this an APRS problem? Bob can we tell APRS to IGNORE all wx alarms?

I'm sure AutoWX is a versatile program, but unless we can get this guy to cut out the false alarms, we'll have to do something to stop his packets from propogating.

Rendered body type: text/plain

HOW ACCURATE does the clock on the GPS receiver have to be? I am curious. A "radar mile" is 12.359 microseconds. That means, if the time of the GPS receiver was OFF by only 3 microseconds, the positions would be HALF a mile OFF. Is that true?

How does the GPS receiver set its local TIME?

Wes Jones wrote:

>>>Obviously, time is very critical and the satellites broadcast time ticks >>>so everyone can "synchronize their watches".

IF the GPS receiver's clock were to "synchronize" by the signal from a satellite, wouldn't the observer (at the GPS receiver) have to know how far the satellite was away FIRST, before he could determine the TRANSIT time, and hence the LOCAL time? I can't figure out which should comes first. I can't determine (in my mind) how to find the distance from the satellite without knowing the transit time. And it is impossible to determine the local time; and transit time from the satellite without knowing first the exact distance between the satellite and the GPS receiver because of propagation delay. It takes TIME for the signal to travel.

I understand how DME (distance measure equipment for aviation) can work because the transceiver KNOWS what time the interrogation signal goes out; and what time the reply signal comes in. But the GPS has no interrogation signal. How does it work?

I am new in this. Please enlighten me. Thanks.

Win 95 will allow up to COM8 with any available (or otherwise not reserved) IRQ. Mouse Systems manufactures a device called (strangely enough) "COM-5", which has a large, jumperable variety of IRQs and addresses.

     Most of the multi-EIDE cards nowadays have a fair selection of IRQs
     and can be installed without enabling the disk controllers. However,
     they generally don't support beyond the four basic addresses...

     There are several quad-port cards out (one I saw at Fry's here for
     under $100) that have a bunch of addresses and a bunch of IRQs.

     73 - Jon NW6H

     p.s. Now if someone could just come up with a box that had a Tbase10
     jack on one side and a pile of com ports on the other, and software
     that would allow the use of theose com ports as virtual com ports for
     a networked computer, and that it could run on NT, then I'd be set!

On Fri, 14 Jun 1996, Bernard Seront wrote about some cheap RF amps for
GPS applications and a group purchase. I asked him about the noise
figure and he says it is 3 dB. Does anyone know what the typical noise
figure is for the hand held GPS front ends?

If they are 3dB or worse, then the RF amps will be just fine for remote
antennas to overcome cable loss. If your hand held has a better front
end, however, then the RF amp will allow you to use a long cable, but the
performance can never be quite as good as the antenna in the unit.

BUT lets say that the GPS specs say you have a 3dB noise figure receiver
BUT it is using an internal patch antenna, then your remote RF amplified
antenna could do much better if you use a *full size* GPS antenna. Full
size meaning 1/4 wavelength size in air as opposed to the small patch
antennas that are less effecient because they have a smaller capture area.
Do the MFRs that quote a noise figure for their handhelds included the
inneffeciency of the small patches?

These RF amps sound like a good deal to me... But I dont know what the
typical specs are for the handhelds?

The GPS *should* derive its local time from the GPS time and add
leap-seconds as indicated by the almanac. Since all a good GPS receiver

is, is a very accurate clock, most of them have pretty good local stability for time-keeping, and resync when they acquire GPS time from the birds. Now: Computation of time may vary significantly. The time displayed can be the last second, the time when the last fix was calculated, or the instantaneously decoded time (!) and there's a lag in determinng which is what. If you're really serious about timing, you get the 1 Pulse Per Second option, and look at (as appropriate per manufacturer) the leading or trailing edge for your timing.

490. Atlanta Maps

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 14 Jun 1996 19:28:46 -0400 (EDT)
To: aprssig@tapr.org
Cc: rwf <rwf@mindspring.com>
Message-ID: <Pine.SUN.3.91.960614175244.1547A-100000@arctic>
Rendered body type: text/plain

I am busy doing some Atlanta detail maps for the Olympics. This heads up so we dont duplicate efforts. I have modifed almost all of the GA maps in one way or another that were in the APRSBSRG.zip file. So if anyone has added antyhing to those maps since that BSRG file, then you better get the changes to me, or hold off till I post the new ones.

All of the big maps GA-1 through GA-XX, I changed the SIZE from 65 down to the real size of the map of about 36 miles

All of the GAAT-14 thru GAAT-34, I changed from 2.2 down to 1.1 mile maps and changed the scale from 10500 PPD to 21000 PPD to give double the resolution. On GAAT-28 I have drawn in the stadium and 10K race route.

I have built a new GA-ATL4 map that covers the same area as all the GAAT-xx maps. It is a 3.6 mile map.

I have built a GA-ATL1 map which is centered on the four corners of GAAT-21 22,27 and 28.

I am waiting on the detail route information for the Olympic Marathon and then I will try to get Bill and Ralph to help me finish street level maps along that route... It looks like it starts north of twon and goes down Peachtree. I assume it ENDS in the stadium. I know that Mile 15 is at the intersection of Peachtree and Pharr Road. Mile 18 is at Peach Tree and Lakeview Ave.

RALPH, can you use the EXTRACT program to extract the files that cover that area on down to the Stadium? I only like to use one 15x15 grid at a time, and it looks like all of this area is in the grid

```
              34 00
           ------------
           |          |
           |          |
           |          |
           |          |
    84,30  |          | 84,15
           |          |
           |          |
           |          |
           ____________
              33,45
```

Extract only that 15x15 cell, then ZIP up the files and post them on Mindspring.
  Then send me a message telling me the FTP address. THANKS !!!!
Maybe ZIP each file and and then tell me the name of the 4 ZIPPED files.
That way if I get an error, it will take less time to try again...
EXTRACT all feateures...

Thanks, Bob. The Ambassador Teacher's Program is a NASA sponsored program,
of some type, I could not find any such approval for the Peet bro's system.
The options are what is available as add ons. Davis has 19 different
"goodies" that can be purchased, Peet has 11. This is for the Weather guru
who wants it all. I am currently doing a side by side comparison of the two
systems, and I can not find much difference in the accuracy....Oh well some
like mashed potatoes some like french fries...to each his own. I hope that
more people will get on the air with Wx, I don't care what they use, a
rectal thermometer, wind sock & compass, and a tin cup are OK by me...If it
is accurate!!!

73, and Thanks for the help!!! Alan

Rendered body type: text/plain

```
A local repeater sysop tonight got excited about putting a TNC at his
repeater since it can be used along with APRS mobiles to plot a perfect
COVERAGE profile of his repeater!

All he does, is collect every Position report ever heard by his
repeater.  Plotting days or weeks or months of these will cover the
map with dots showing where he has GOOD coverage.  Marginal or weak
packet posits will most likely not be plotted.  So the resulting plot
will show the reliable coverage of the voice repeater!

You might say that most of the DOTS will just be along the major
highways...  Well, isnt that where most mobiles will be anyway?
Its usually mobile coverage that most repeaters are interested in anyway...

> How does the GPS receiver set its local TIME?

APRSdos REPLY COMMENT:  THe whole concept of GPS is that the GPS receiver
computes the time of arrival of all signals and therefore can infer what the
precise time is on the satellites.  The GPS-20 board being sold by TAPR
has this precise time output in the form of a 1 pulse per second.  But
the edge of that pulse is accurate worldwide to under 1 microsecond.

In case the author does not answer one thing to check real quickly
is the Peet Wx Station.  It must be set to Complete Record Mode!

I don't remember the key sequence but it is in the documentation.

We just installed AutoWx last week at N4PBF and it works just
elegantly!

The National Hurricane Center in Miami just got a demonstration and
they were just overtaken with the ability to query a remote site,
find out the weather and compare it with other locations!

It is a well timed contribution and South Florida will gain
optimal use of this software!

>73 de KB9JTT

--------------------------------------------------------------------------
The Emergency Alert System is the replacement to the Emergency Broadcast
System.  EBS is based on the long two-tone alert which every radio and TV
station tests once a week ("This is a test...").  EAS adds FSK signaling in
a header which encodes the type of emergency, the date/time, who originated
it, etc., followed by the same two-tone alert, then a voice message, then an
EOM packet.  EAS will begin for broadcasters on Jan. 1 1997.  EAS is not the
same as SAME on NOAA weather radio, but they are compatible...in fact, a lot
of broadcast stations will be monitoring wx radio and retransmitting the FSK
headers/voice message since they are compatible.

I'm part of the committee planning the South Wisconsin Operational Area
"local" plan for EAS, and am trying to find out how amateur radio will
interface with the EAS system.  The new EAS rules are found in the new Part
11 in the FCC rulebook.  More info on EAS can be found on the Society of
Broadcast Engineers' web site at   http://www.sbe.org

>
>Ralph
>

He has an older version of AutoWx that used 999 to indicate the program had
received invalid data.  I originally thought that would attract the user's
attention to the problem so he could fix it.  I didn't realize the conflict
with the APRS alarms until Bob pointed it out and then it was changed.

If you can contact the guy, have him download the newer version from the
ARRL BBS.  Or...  if you will furnish his callsign (by personal e-mail to
me) I'll mail him a diskette with a newer version of AutoWx.
```

The problem is the result of an invalid setting or the 999 wouldn't be showing up. However, it was a mistake on my part to use 999 in the first place. (Newer versions use 000)

I can go looking for the data (it's at work, and I'm at home) but a NF of 3 dB is marginal fromw hat I recall. M/A Com uses some 1 dB parts for their preamps. With the gain figures some of the manufacturers claim (Trimble comes to mind) a gain of 40 dB (no kidding!) and a 3 dB noise figure could be painful. Of course, most of the mfgrs plan to have the preamp at the antenna...

Wes is quite correct regarding the timing accuracy required by GPS. The receiver clock is corrected with a bias that is computed as part of the GPS navigation solution. The four variables solved for are x,y,z for position and t to correct the receiver time. What makes GPS work are the miniature atomic standards that fly on it, 2 each Rubidium and 2 each Cesium standards. There is a GPS home page on internet that contains a tremendous amount of information on the system, I'll post it later. Clyde- WA6DCM

I was wondering are you referring to the ability for it to announce the
information verbally? Peet Bros did have a unit at Dayton that you can
interface with the Ultimeter and it does announce the data in Australian :-)
down under via phone or touch tones.   I am not sure how elaborate the Davis
is, but I thought it would be neat if you can use one weather station and
have it hooked up to APRS, and available to access on a repeater also, dont
know if possible, I guess its a matter if you can splice a data stream and
still maintain the voltage for a readable data to both units.

>
The mathematics are not simple, but using simultaneous equations it can
be solved, using an extra satellite. That's why it takes 3 sats for a 2d

fix, 4 sats for a 3d fix. If your GPS already new the _exact_ time, only
2 sats would be needed for a 2d fix.

504. Maps

I don't know if any of the mapbuilders are aware of this program called DLGVIEW. Its a big help i think in looking at the area you want to map and see how dense the data is. I did a view of the complete road file 3.5Meg of Huntsville,AL and it will show every road within that file, showing the heavy populated areas. To bad we can't just save that info to a file Hi. There is a file provided in basic that could be used to rew-rite the software. It was written by a person named Sol Katz and is on one of the USGS sites. I did attempt to do a copy to combine all off the files (Roads, Hydro, etc) but that didn't work because it still only viewed the first file. One thing you do have to do and that is when downloading a file from the CD you will have to add the XXXX(.DLG) file extension to it. If anybody is interested i will try to find the URL for this file since i didn't save it as a bookmark Hi, but i do know where to look.

505. Re: [APRSSIG:1954] HOW ACCURATE is the clock?

From: n4nr@vulcan.com (N4NR)
Date: Sat, 15 Jun 96 09:01:00 -0600
To: aprssig@tapr.org
Message-ID: <8C2921D.0012001903.uuout@vulcan.com>
Rendered body type: text/plain

-> HOW ACCURATE does the clock on the GPS receiver have to be? I am
-> curious. A "radar mile" is 12.359 microseconds. That means, if the
-> time of the GPS receiver was OFF by only 3 microseconds, the
-> positions would be HALF a mile OFF. Is that true?

Yes...The clock in the GPS rx does not have to be accurate enough to determine exact distance with ONE satellite. Think of it as getting distances from 3 different sats...each referenced to a GPS rx clock that's 3 us "off"...you would get three different locations...now draw a triangle connecting the dots...you are in the center of the triangle. The GPS rx resolves the center of that triangle. (or a three dimensional figure if >3 sats are involved)

This way, only the clocks on the sats themselves need atomic precision.

Does that help?

Dennis - N4NR

I did this the first day that my UHF repeater was up but without the bells and whistles. I just set up a HT on the repeater runing APRS then set off with my handypacket/gps driving. Since the repeater is mine and I would not clog up .79 I just set up the TNC to transmit every 10 seconds. I also had a good idea of how well it was doing since I set up the mobile to digi via the house. Everytime a packet that had a good S/N ratio made it thru the HT would digi it back so I had a immideate conformation even though I was 40 miles away. By the time I got home I already had a good idea of where it covered and confirmed it on the map!

> 2 sats would be needed for a 2d fix.

Er, ah... 'Fraid not.  The solution for a GPS position is a spheroid of
probability.  Knowledge of the pseudorange of a satellite, based on almanac,
ephemeris and clock solutions, yields a probability that you are on the
surface of a sphere around the satellite.  intersection of that sphere with
the earth's surface yields an approximate ellipse of positional probability.
Adding a second satellite to the solution matrix places you within a volume of
probability  defined by the intersection of the spheres associated with
pseudorange solutions for the 2 satellites. Resolution of the solution to a 2D
position requires a third satellite, while resolution of the Z axis component
requires a fourth.  Even with precise time definition, you cannot resolve 2D
fixes with 2 satellites...  Sorry.

Gerry

508. GPS20 questions

From: tdrumm@sparc.isl.net (Tony Drumm)
Date: Sat, 15 Jun 1996 12:02:48 -0500
To: aprssig@tapr.org
Message-ID: <199606151707.MAA07855@sparc.isl.net>
Rendered body type: text/plain

```
I finally had a few minutes to connect up the GPS20 and see how it's
working.  I used a 7805 with a 9v battery which seemed to power it up fine.
Connected it to the computer and used a com program to watch the data.  Sure
enough, I get a burst of messages once a second.

It seems to be finding satellites but will not come up with a fix.  I moved
it outside and have used both the "Blackjack" antenna and one of Bob's
suggested 1.8" wire.  The satellite data seems to be incomplete.  The
documentation for the GPGSV message says the SNR will be null if the
satellite is not being tracked.  Some are this way but others are also
missing the elevation.  Some have SNR but no elevation.  Also, the time
seems to be about 3 minutes slow according to my watch which is usually
within 30 seconds or so of WWV.

Here's a sample of the data:

$PGRME,,,,,,*4D
$GPVTG,,T,,M,,N,,K*4E
$GPRMC,155806,V,,,,,,,150696,,*33
$GPGGA,155806,,,,,0,00,,,M,,M,,*69
$GPGSA,A,1,,,,,,,,,,,,,,,*1E
$GPGSV,2,1,08,04,,090,,05,47,094,,07,,038,44,14,,302,*7C
$GPGSV,2,2,08,15,00,344,40,18,,175,,19,,073,,27,,060,*77

Any suggestions?

I had the same problem.
If you dont get a S/N number then the GPS does not see the satellite.
Everything was ok only when I put it outside with a good antenna for a
couple of hours, it take it time to build the initial Almanac.
As to the clock, the time you see is factory set, when you will have
a fix the clock will be reset by the satellites.
When I got mine it was 6 minutes off GMT but after getting a fix
everything was ok.

Rendered body type: text/plain

I tried WinAPRS with OS/2 Warp and got an
error message: "unexpected DOS error 23"

OS/2 Warp can deal with win32s up to version 1.25.
Does WinAPRS actually require win32s 1.30 to operate
or can it be coerced into running with 1.25?

512. Need Help with Stand-Alone Tracker!!!

From: ku0g@sprynet.com
Date: Sat, 15 Jun 1996 11:09:31 -0700
To: aprssig@tapr.org
Message-ID: <199606151809.LAA19643@m1.sprynet.com>
Rendered body type: text/plain

I bought a KPC-3 (v 6.0 firmware) yesterday. Building a stand-alone tracker for
bike ride tomorrow (Sunday). Here's the scoop....

The GPS is sending its data to the TNC but the TNC is not accepting it
(apparently). TNC IS sending its normal beacon and ID OK.

I look at LT and all four buffers have nothing in them.

I followed the Kantronics docs on how to set up for GPS operation. Here's what
I did....

Hardware: GPS-45 yellow (brown) wire to pin 2 on TNC, black (ground) to pin 7
(Frame/Signal ground verified by VOM).

Software: TNC Commands set as such (only ones I did)

```
MYC MED-1
MYR KU0G-15
(I set the p/w but not going to list it here)
GPSHEAD 1 $GPRMC
GPSHEAD 2 $GPGGA
GPSHEAD 3 $GPGLL
(nothing on GPSH 4)

LTP 1 APRS V RELAY,WIDE,WIDE
LTP 2 APRS V RELAY,WIDE,WIDE
LTP 3 APRS V RELAY,WIDE,WIDE

BTEXT {a}KU0G-15 Wheels to Weston Bike Ride 1996

B E 10

INT GPS
```

At this point I shut off TNC and restarted to initiate GPS mode.

What's wrong? I've GOT to make this unit operationaly by midnight tonight!!!!
I'd pay real money (a figure of speech, of course) for some serious expertise!!!

Would prefer a collect call so I can be working with the TNC while we talk!!!

(816) 746-9205 Say who you are and your ham call and I'll accept the
charges....

Thanks for your help, in advance!

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

More info...

I screwed up by assuming win32s 1.25 was installed on the computer in the above test of WinAPRS. It wasn't!

I copied WinAPRS to another OS/2 machine which happily runs a couple of other win32s programs. The results were completely different this time: WinAPRS locked up the computer so tight even ctrl-alt-del wouldn't reboot it!

I'm casting my vote for a native OS/2 port of WinAPRS.

As posted before may take up to 15-20 min to update sat data base.
I waited 30+ min with a Garmin-45 once.

>seems to be about 3 minutes slow according to my watch which is usually
>within 30 seconds or so of WWV.

The time may not update from internal clock to GPS time until you get a good GPS fix.

Run the NMEA data stream into bob's sig plot or MAC/Win aprs to see a heads up display.

Upon further reflection, I retract my statement, but I do take exception
to one point you make. If the receiving station had an accurate atomic
clock, the fixes would not be pseudoranges, but true ranges. There is no
probability involved. The intersection between the two range spheres
would be a circle, intesecting that with the earth would give two points,
so yes, you would need a third satellite to decide which one.

How long did you wait? It took my units more than ten minutes to get get
the initial fix. Since the unit doesn't know where it is, it doesn't know
which satellites are in view, so it has to search for all of them. Since
it is a single channel unit, it takes a while. Sooner or later it will
find one, and then it will set it's clock with the correct time.

If you hooked up the RS-232 input you can give it an initial position and
time that will speed up the process.

So far I'm not too impressed. These units seem to have a problem when one
satellite it is using is lost from view. Rather than immediately
switching to another satellite, it seems to use a warm start procedure,
takes 15-30 seconds to lock on again. I drove downtown, with frequent
occultations by the buildings, only got data maybe 25% of the time,
verses 100% with my Motorola 6 channel parallel rx.

Another quirk, the unit seems to suffer from 'grade inflation'. When the
SNR drops to 33 on a satellite, it is lost. The Motorola tracks down to
the 10 or 11. Most of the time I get SNRs in the mid 40's when I have a
clear sky view.

Message-ID: <199606152050.QAA06172@unix.asb.com>
Rendered body type: text/plain

```
Further to my original message. I have an extra I/O card on which I have
disabled the FDC, HDC, Parallel Port and Games Port. I have set Serial 1 to
com3 (3e8, IRQ5) and serial 2 is disabled. The basic system has com1/2 at
the normal addresses and irq's. Win95 finds the port but assigns irq4 to it
and it won't let me edit the IRQ number. As you would expect the system
doesn't work!

If I set the com3 port to irq4 then it does work under Hyperterminal and
Procomm Plus but when I run winAPRS it won't read any data from com3 (and my
Ultimeter II).

My question is why won't com3 work at 3E8 and IRQ 5? Is it to do with IRQ5
normally being used for LPT2? Anyone got any ideas?

Any help appreciated

Thanks again

520. Map Builders

From: William Nolle <wnolle@ix.netcom.com>
Date: Sat, 15 Jun 1996 15:57:13 -0700
To: aprssig@tapr.org
Message-ID: <31C33FC9.2740@ix.netcom.com>
Rendered body type: text/plain

For those Map builders on the sig, i just uploaded a file named DLGVIEW it allows you to look at any of your CD files before actually making a map of it. This is great to see how populated the area is that your going to make the maps of. I did some playing with it and took a file for Huntsville,Alabama of 3.5 meg and it didn't have any problem with showing the all the roads in the city. I attempted to chain all the files (Raods,Hydro,etc together using COPY but it didn't like that. There is a text file with the file i uploaded so you can read it first altough the file is not that large. One thing you will have to do is add a .DLG extension to the files you want to look at. Hope it will be of some use to you map builders.

>
>The lockup people talk about . . . Seems to be related to the fact that there is no Map Window OPEN. I close all maps windows and at the next Packet RX, I get an Unhandled Execption error.

to which Keith Sproul replied on Wed, 12 Jun 1996:

>This is a CONFIRMED bug and has been fixed.
>Until the next release, keep at least one window open.

That's what I thought at first. I often left WinAPRS up when I went to work. One day, before leaving the house, I checked the weather and WinAPRS was running fine. I closed the Weather List and it was still OK. The only other thing I did to the computer before leaving the house was to shut off the monitor. I arrived home to an "Unhandled Exception!" I suppose it's possible the cat jumped onto the keyboard while I was out, but he doesn't like my desk (no place to lie down and nothing to eat.)

There are other things about WinAPRS I'm dissatisfied with which I've addressed before. I'll admit it looks VERY nice and has some high-tech features APRSDos (DosAPRS, whatever) lacks, but when it comes down to simple, basic utility and versatility I'm sorry to say I'm going to stick with The Original.

Sorry Mark and Keith but, although it does everything you say it'll do, when it comes down to brass tacks I HAVE to compare Apples and Grapes. IMHO (and please forgive me for this, as I've been supportive of your effort,) while WinAPRS will allow me to get the name and address (via C-D) of a station, show me MANY more stations than Bob's version currently will and has FABULOUS maps, there's no way to tell your program that I want this message to go to that station via anything but my beacon's unproto path, I can't FIND a station by typing in its callsign (or clicking on it from a list) and it can't even let me edit the maps to accomodate some special event (such as a marathon or similar course.)

I've supported Mark and Keith in their BETA efforts since the release of 0.2.0 and have thought the progress and improvements with each new one to be terrific. Since the release of WinAPRS 1.00, however, they have been relatively silent on the SIG about their brainchild. One hopes they are too busy addressing the comments that have been aired here and 1.04, 1.06 etc. will show me to be wrong. As I've never run and only once SEEN MacAPRS I don't know what it's current capabilities are or whether the issues I've raised have long since been solved in that more mature (and, supposedly, more stable) environment.

I LIKE WinAPRS! IT'S REAL PRETTY! As I've said before, I'm sure there'll be MANY more releases. APRS is one of those

programs the authors like to keep tinkering with ... not because it's broken, but because there's something else they'd
like to add to it. Please prove me wrong in my opinion, guys!

According to all of the test info that I have, WinAPRS requires Win32S 1.3
All testing with 1.25 has proved that it does not work. I have not been
able to find anyone with enough OS/2 experiance that understands the
difference between 1.25 and 1.3 to figure out what is going on with 1.25.

I agree with Assi's answer to your time/fix problem, having exprienced the
same thing...you have to be patient and wait for the unit to discover
where it is by building an almanac. It took me two hours of playing to
discover that the unit simply has to see enough satellites to acquire the
almanac. Then it'll work great. My problem was I didn't have an adequate
antenna at first.

HI Joe, I Think you must also set the BLT for each of the LT's

ie: BLT 1 EVERY 00:01:10
    BLT 2 EVERY 00:05:00   etc
This would set Buffer 1 to beacon every 1 minute 10 seconds and
Buffer 2 every 5 minutes 0 seconds etc.

Check the "Setting Parmeters in the KPC-3" for the info.

It's saying it has not found the birds.  How long did you have it up with the
Blackjsck antenna (I remain skeptical of the 1/4-wave for relatively deaf
receivers...)?  I believe it diesn't know where it is, and will have to
acquire its birds via "skysearch" where it looks for up to 30 minutes to find
adequate satellites.

After it gets a good lock on a satellite, even one, it should have a complete
almanac in 13 minutes.  It still thinks it's in Kansas, though, so it's
looking for the wrong satellites.  After it figures out that not all PRNs are
available (PRN 12, the last of the Block 1 birds was "healthed out" a couple
of months ago... more's the pity) it still looks for birds based on its last
fix.  After *that* times out, it starts looking through the whole sky for
anything, and builds an idea of where it is from there.

> When I got mine it was 6 minutes off GMT but after getting a fix
> everything was ok.
That's a little excessive, but acceptable for an initial setup, I guess.  I'll
have to look at the Trimble and Motorola receivers and see what their
power-off latency and drift are.

> probability involved. The intersection between the two range spheres
> would be a circle, intesecting that with the earth would give two points,
> so yes, you would need a third satellite to decide which one.

Nope, they'd still be pseudoranges.  The ephemeris is not precise, but
propagated at the point you receive it, so the data are an estimation.  When
you post-process the data for high-precision/high-accuracy work, one element
is to get the precise ephemeris data from NAVCEN, UNAVCO, GSFC, Scripps, or
Bern and recalculate the data based on where the satellite REALLY was.  Then
you apply the base station corrections to the new, more precise, pseudorange
solutions, and go on.

What you WOULD have would be a better mechanism to resolve integer ambiguity
in determining which precise wavelength of the signal arrived (phase
measurement).  This would provide a more precise solution than one with
remaining integer ambiguity, where the receiver merely guessed at the integer
solution and used it for the next N period of time.

Finally, just as orbits should always be thought of as ellipses, so should the
position solutions be considered as intersections of individual ellipsoids.
It's hard to achieve a perfect circle or sphere!

Unfortunately, Microsoft "enhanced" Win32S v1.3 sinificantly, and has not
released all the "enhancements."  What I've been told is that the Merlin beta
release of OS/2 should fix the latest level of induced incompatibility...

73 gerry

OK, I can't stand it any longer  ;-)
```

```
Let's go for a port to a REAL opsys WinNT.
Been running it for over a year, and I'll
take it over OS/2 any day.  I used Warp 3.0
for a while and finally gave up when trying
to get MSYS 1.15 to run consistently under it.

With NT3.51, MSYS 1.15 runs well, with NO hiccups!

Please no flames...  <g>

Dale.

He gave a Clue in his message that brought me to the answer.

Jim had forgotten that the $GPGGA and etc. needed to be capitolized.

Even though he didn't mention the BLT stuff,  the clue was he wasn't
saving any Buffers either.  SO those buffers need to be filled to be
sent and they don't get filled unitl the GPSHEAD string is a match.

IF the GPS sent out $gpgga and whatever, then all would have been
well.

REMEMBER: the GPSHEAD strings on a KPC-3 MUST be set to all Caps. or
it won't be accepted into the Buffers for transmit.

No port is necessary - WinAPRS runs quite well under
NT right now and, in fact, is a native NT application and
was developed by the Brothers Sproul on NT.  I use
NT almost exclusively, like OS/2 and the Mac fine, but
detest Windows 95 (not enough to intentionally misspell
it, though)

Rendered body type: text/plain

```
Hello Name here is David.
        I have been having trouble with sending and receiving ack's from messages.
I run a -14 when running mobile and my wide area digi is -10. If someone tries to
send me a message to either of these call's. It will not ack them. If I drop the
-14 or the -10 on the digi, everything works just fine. The digi's tnc is a
pk232mbx and the mobile is a Kam Plus. I have tried resetting both to factory
default. Then set the sceen length to 0 and all line feeds off. I thought that it
might have been the path but if I drop the -10 or -14 it ack's everytime.
I am not the only one with this problem. Thanks for the help!

You also have to look at and check the INTERUPTS, I have 4 com ports active
and WIN 95 had a fit with it for a time. I found out my motherboard took
control of which interupt the video card had. Then it and Win95 proceeded to
dole out the other interupts etc. When I got to setting the 4th port for my
KPC-3 to use I was having lots of fits. I had to investigate what devices
where using what interupts and compare that to what was available and that I
could move about. USE CAUTION HERE!!!!
  This is not nessecarily a Win95 problem, if anything, I was about
manipulate these a bit till I got it all to work.
  Again    USE CAUTION as you can lock your PC up!!!!

  I dont know that you can go beyond COM 4 with standard serial cards. I do
know that you can buy Multi-Port serial cards with 8 or 16 ports on them.
They are commonly used for BBS's. They use a driver that assigns all the
ports etc. These can be VERY Expensive unless you can find them used someplace.
  I bought my serial card from a Computer City store, it works fine with my
Pentium and Win95.

Hope this info helps, 73

I've decided that Windoze 9x is not a direction I want to go. We are runing Nt 3.51 at the office as the platform of choice and it does quite nicely. Me? Since I inhereted the runt machine of the litter at the office, I'm running Warp, and it just does everything in 16 MB that the NT boxes are trying to do in 32...

Of course, I didn't have to try to get MSYS up...

gerry

ps... I don't get NEARLY as many GPFs with NT as I got with Win311. Usually about one a day with NT, using NT-specific software. Haven't seen that with Warp yet.

You did not show the following info in your messege. You have to tell the KPC-3 how often to beacon the buffers. BLT 2 is set up so that BLT1 and 2 are reporting every two minutes with the data but a minute apart.

```
BLT
1 EVERY 00:02:00
2 EVERY 00:02:00 STARTING AT 00:01:00
3 EVERY 00:10:30
```

I hope this helps,

Bruce

Will agree that the a large number of comm ports can be expensive. I run the
Digiboard 8ei which give me an additional 8 comm ports (10 total). The Digi's
(they have 4's, 8's and 16's) operate using 1 IRQ and a 64k block of memory.
All data is transfered thru that block. The board has an on-board processor
that further sends it on its way to the proper port. I have been using mine
to run several modems for a land-line BBS. Cost, through BBS Solutions, was
$601. There are additions that can be purchased. You can go to 'RJ' style
connectors or DB-9's or 25's. They are also very nice in creating a small LAN
but I have never used mine in that way. Installation took about 5 minutes for
the card and 2 minutes for the software. Getting ready to add a second one!

Question, are the 100k opt data files on USGS still usable since they
changed format a while back?. If so they need to be unblocked, they
reccomend CHOP.ZIP but i haven't been able to make that work for some
reason (Probably giving it the wrong command). I know UNBLOCK.BAS is
listed on tapr but tapr seams to be down and i haven't been able to
access it for a while again.

My 386 has a buss mouse adapter card in it, set for IRQ 5, which freed up
the serial ports for tnc/U-II.  Got the adapter card at a hamfest for 19$.
Now I can run APRSdos/WinAPRS with a U-II, and still have a mouse.

Jack Cavanagh asked about the exact 3000 limit in APRSdos maps.  Here is
the scoop...

The 2999 limit is the array size.
0,0        *  These two lines are combined into one array location
7,name     *  The 0,0 and 7,name  combine to 0,7 in the array
x,y
x,y

That is why you can have no X values of zero, since it will look like a
new line...

Well, I guess I forgot to mention how long I waited since everyone asked me that! I set it outside for a good hour. The blackjack antenna was on it for probably 20 minutes or so. I wanted to give it time. Sounds like it needs even more.

When I first started it, it was cycling through the birds, one at a time. I took that to be "searching the sky". Eventually, it ended up with the two lines of 8 satellites that I put in my earlier note. I interpretted that as having finished the search. I'll set it out for a longer period and see what happens.

>It's hard to achieve a perfect circle or sphere!

But if you are talking about ranges or pseudoranges from a satellite, that is a theoretical construct, and therefore easy to make a sphere or circle...unless you are implying that radio signals propagate through the 'ether' at different speeds in different directions. I'm pretty sure Einstein et. al. settled that!

APRSdos REPLY COMMENT: This is a problem. We have several EGO bulletins in our area too. Most of these Bulletins should be BEACONS. APRS was designed with two primary screens, the MAP and the LATEST BEACONS page (more got added later). The map shows posits and the LATEST BEACON page shows you the ONE-LINE status or BEACON from each station. Look at the LATEST BEACON page for a one page summary of what EVERY station is doing.

On the Naval Academy boats, the crews are required to update their BEACONS once every 4 hour watch. Then the duty officer at the Academy can see at a glance the status of all boats on the LATEST BEACON page.

I do not get the feeling that HAMS are using the BEACONS as their ONE-LINE BULLETIN to the WORLD as it should be...

Is anyone using the DFjr with APRS and GPS yet. I would think by now some
of the beta testers would have something (Good or Bad) to say about the
system, specially after the antenna problem. I am still waiting for mine
after nearly 5 weeks now. I asked if they where realy truly shipping any,
but never got an answer to that part of my question. Sure would like to
hear some feedback from those that actually used the DFjr rather then
just looking at the Agrelo web site picture Hi. Does it even work?. Guys
i'm not trying to start something here, but when shelling out that much
money for something i haven't heard anybody give any feedback on makes me
rather jittery. Now i know Agrelo will stand behind their equipment
that's not a problem, Just like to hear some real DF stories!, specially
the ones using APRS and GPS with it..

>w2g3zfj@unix.asb.com
It will except with APRS, which will only recognizes irq 3 and irq 4
for com 3 and com 4.
Your best bet with win 95, seeing as win95 requires a com mouse
to be on com 1 or com 2 and will not recognize it on any other
com port is to put a buss mouse in the win95 machine, that way
you can use com 1 and com 2 for APRS with standard irq's
That is the only way I could get my system to function with
APRS   com 1, tnc,    com 2, U2000 , and bus mouse
hope that this helps you out

557. PK-12 Tracker Problems

From: BordingK@aol.com
Date: Sun, 16 Jun 1996 14:52:30 -0400
To: aprssig@tapr.org
Message-ID: <960616145229_415311922@emout10.mail.aol.com>
Rendered body type: text/plain

Another General Plea for Assistance:

1. Attempting to build a stand-alone GPS Tracker for the vehicle. Using AEA
PK-12 (with GPS ROM), Radio Shack HTX-202 HT, and Magellan Trailblazer GPS.
Device will not automatically transmit posits at the selected intervals.
 Same cable works with VISTA Moving Map software which reads NMEA data and
displays position.

2. As per the AEA PK-12 GPS instructions entered:
     a. MY KF4COH-9
     b. UN APRS via RELAY
     c. GLOCtx 2 (20 seconds)
     d. GNMEA1 $GPGLL
     e. GNMEA2 $ GPVTG
     f.   Then GPSMode 1

3. Following Troubleshooting and Results:

     a. Hooked same PK-12 and HT up to laptop running WinAPRS and it beacons
and sends Non-GPS posits at selected rate. Keys tranmitter and sends a
packet.

     b. Hooked the GPS up to a laptop running Windows Terminal program and
watched NMEA data flow by.

     c. Put it all n the car and nothing happens!

4. Any suggestions?

560. Stamp controller for ICOM available

From: KD4EMI@aol.com
Date: Sun, 16 Jun 1996 16:21:20 -0400

To: aprssig@tapr.org
Message-ID: <960616162119_557460384@emout14.mail.aol.com>
Rendered body type: text/plain

```
Ive finished work on the stamp controller for my IC706.
The stamp will work on all icom radios. I am trying to locate other brand
radios and see if I can make stamps for them as well.

What will it do ?

At present :
The stamp controller will change the freq, mode, and practically any other
computer controlled parameter on the radio automatically. You select the time
you want to change and there it is.

For example, you can operated 1 band in the morning, and have the radio
change freqs in the afternoon and again at night.

Also, you can send instructions to your tnc to change it's parameters as
well.  Operate GTOR in the morning, Packet at night, or whatever makes you
happy.  While mobile, the real beauty of this device is that you can (with an
autotuner) operate APRS on VHF and HF (With a IC706).
When the stamp gets data from a KAM on the VHF side, it switches the radio to
VHF, and the same for HF.

Im still working on the recieve part, but many of us just xmit our positions.
In addition, I'm working on having the stamp  send ack1 , ack2 etc to
stations sending one line messages via aprs. (Ive not yet got it to send it
to the mailbox). IT will store these msgs in a buffer, and you can d/l it
later.

I also hope to have the voice interface on line that uses a separate voice
chip that might be able to read some data aloud...This is in the future
version.

Working knowlege of stamps isnt required but helpfull.  I will not sell these
devices yet, but working out some details to offer them commercially. I
wanted to announce that they will be available soon.

If anyone has an "EMERGENCY" application that really needs one of these, I
can loan one out. (Eg  Special event, emergency, etc)

One APRS user has asked me to see if I can read NMEA data from a gps. Ive
tried everything and have not been able to ..  I hope that if someone has
done this, they could offer me some advice.
(though not sure why Id want to be able to quite yet)
--------------------------------------------------------------------------------
----------------
The lighning monitor has proven a bit more difficult. I can get it to talk to
the computer, but need someone who can write the code (Bob ?)  that will read
the strikes and make the data xmits.
--------------------------------------------------------------------------------
-----------

Cyclades has a special promotion going on for sysops, ISPs, and resellers.  Their 8YO
card, which is 8 DB25s on an "octopus cable", is $199.  It's a coprocessed card like the
DigiBoard.

Their historical user base has been Unix systems, so most of their drivers are written
for that.  (Plus, a DOS INT14 driver.)  An OS/2 driver is out, as well.  An NT version
was just released, and a 95 driver is "to be released".

I've been using one under Linux for about a year now, and it works really well.  I hooked
two ports together with a null modem adapter, and transferred several megs via Zmodem at
115K.  Barely noticed a rise in processor utilization; most of that was probably in
Zmodem.

Check them out..  http://www.cyclades.com

That is correct. Since the speed of light is absolute; and thus light waves
travel at the same speed in all directions, therefore the propagation of the
light waves from a point source is spherical.

>>>was developed by the Brothers Sproul on NT.
>>
>>I understood it was developed by the Sprouls on a MACINTOSH and cross
>>compiled to 95 or NT.

MacAPRS was developed on a Mac, WinAPRS was "cross-compiled" - I assure
you,
as a professional software developer for 17 years, this *is* a
development process -
on WinNT.

>>I think they tested it on both platforms, but developed it on neither.

This is probably a semantic difference between our points of view,
Ralph.  To me, what
they did on NT counts as development, too - they started without
functional software on
NT, and did a bunch of stuff that resulted in having functional software
on NT.  That's
all I meant.

>>That's what I devived from their speech at Dayton.

This info comes to me straight from the Sprouls, unless my memory is
faulty.

Well gosh i didn't see that message i guess. I just got trough making
a grid of 100 Atlanta maps Top left 33,55.68N x 84,33.76W
Bottom right 33,35.42N x 84,01.47W Hope that covers the area your
interested in if not let me know quick. I will tell you one thing
that using the USGS data is about 6 times slower then using the CD
data files. Took 3 hours and 12 minutes to make the 100 maps. When i
made 100 maps from the CD it only took about 40 minutes. Boy i
wouldn't want to try this on a slow machine Hi. By the way every map
made it with less then 3000 points at 1.05 range...

I understand that if your icom has a computer interface port it will work.
I dont even know what a 720A is...But if it uses the ICOM computer standard,
yes it will.

If a 720A doesnt have a computer port, then that question is kinda silly.

Tonight there is a lovely display of heat lightning.

My Lightning monitor is going crazy, indicating strikes every 3 seconds..

The good news is that the amplitude of the pulse it is sending is much
smaller than the big BOLTS that we get here.
AND
I was able to dectect the incoming storm about 200 miles before it hit.
So at least the theory is feasable, that is, detect the storm before it hits.

I would very much like to be able to direct connect this into a computer or
tnc. Using the basic stamp is neat, but adds alot to the cost.

Can any of you programmers come up with a way to count pulses on a rs232
port..? Can a conputer tell the diff in amplitude or will I need a box to
convert this..? Also, code needed to quantify the pulses to indicate that
they are getting closer..

Any help appreciated.

> HELLLPPPPP ?????
>
> Mike
> KD4EMI@AOL.COMHi Mike,
    I am very interested in lightning detection using VLF (2 - 8 Khz)
receivers and associated whistlers chorus etc which is also attributed
to lightning. I have Steve McGreevy's WR3E receiver coming to use in
my recording of induced lightning strikes here at Camp Blanding, Fla
(Starke FL) where Dr Uman of Univ of Fla (Gainesville) is conducting
experiments in lightning affects on underground/buried utilities and
is inducing the lightning by firing rockets with wire back to earth
so that he has, more or less, lightning on demand.  Your application
to detect range and azimuth is used in the commercial aircraft "Ryan
Storm Scope" which was first described in 73 Magazine in 1963 or 64.
I built four basic VLF amps and fed them to the x y plates of a CRT
to determine direction and approximate distance (amplitude) but that
was a very crude affair compared to the systems in use by NOAA to
detect lightning strikes location and frequency. I recommend you look
at Univ of Iowa home Page

Hi Again,
     Sorry but i hit the wrong key and somehow sent the first
message incomplete. the pages I have located data on are as last
mesage said Univ of Iowa Steve McGreevy which you can locate with
a search engine easily. also Univ of Florida  Dr Uman.
     What type of detector(s) are you using for your system and
are you using an oscilloscope or an AD converter to your Computer?
I use GRAM22 for audio presentation of recorded lightning and all
its associated noises. You will find it on the Steve McGreevy pages
at the Univ of Iowa along with many ZIP files of various lightning
detections etc etc
   I am not too competent at forwarding files and URL etc but I will
try to send it along as an attachment. Hope it works out right..
I am located in Middleburg Florida about 3 Miles North East of Camp
Blanding (25 Miles South west of Jacksonville(Duval County) line.
I would be intersted in hearing from you and exchange results etc!

     I forgot to comment on your use of the words "heat Lightning"!
Actually what is called  heat lightning, is only reflections from
very distant storms across an atmosphere that has sufficient moisture
or dust particle to reflect light and it is normally ( as I understand)
the higher level (cloud to cloud) lightning that causes the visual
reflections over very wide distances. Recent discoveries of upper
statosphere Red and Blue Spites discharges into the outer space may
be ( my observation ) the cause of some so called Heat lightning that
is seen many miles away from any known storms.
```

again 73 and look forward to hearing from you and of your findings!

Your solution is a reasonable generalization, but, in fact, velocity of
propagation does affect the pseudorange calculation.  A generalized
ionospheric model is incorporate in the GPS receiver, and updated by almanac
data if the sky's really skewed.  for higher precision work, comparisons of L1
and L2 yield an indication of propagation and a fudge factor to be
incorporated in the code-phase solution of pseudorange.

Hi Michael

I've been working on a similar project here but have given up on the STAMPS.
They are OK for smaller projects but if you need faster I/O and a fuller
featured BASIC then I can reccomend the DOMINO from Micromint (860 871
6170). This uses an 8052-BASIC with 32K static RAM and 32K EEPROM, 12 I/O
lines, RS232/RS422 interface, 2 interrupts and 3 timers and it costs $79-.
Its a module 1.1"x1.75"x0.4".

One particular project I have is to generate an RMC sentence from separate
GGA and VTG sentences plus adaptive digi'ing for aprs tracker/mobile use.

Rendered body type: text/plain

```
I am in the testing phase of the DFjr/GPS/APRS Mobile setup.

As a stand alone RDF, you can't beat it. This baby works! I had mine
assembled, stuck to the roof top, and DFing within an hour after I
recieved it. (It took exactly 8 weeks to get here, so have patience)

Putting everything together, the DFjr, GPS, APRS, IS A REAL CHALLENGE!!! I
```

am running a 486 laptop with a single port. The adapter that Agrelo sent works just fine. And Bob has setup a special command just for the DFjr. Just watch out for all the wires! I am working on a way to install this in a nice, neat package.

There are a few 'bugs' in the system as it stands right now. But these are being worked on by myself and Agrelo. Bob has been very helpful as well. These are NOT major bugs! It's the type of thing that can usually be worked out over the phone, and I'm sure will be included in the documentation at a later date.

I'm the guinea pig on this one! It's fun though!

Final Thoughts.......1) have patience, the DFjr will arrive, someday...... 2) the DFjr works very well......by itself, 3) I wasn't kidding about the wires......4) putting it all together is a challenge and a lot of fun.

As soon as you start talking serial ports above 4, the selection of hardware drops from lots to almost none. However, not zero. I use a serial board made by "4-com" which is availble from NECX (look in computer shopper or http://www.necx.com/), among others no doubt. It gives you 4 serial ports, all with indepent address and IRQ settings, all on 1 card, shipped with nice little adapter cables allowing direct plug in of DB-9 connectors. Win95 will support additional serial ports by setting them up in control panel. Send me personal email if you want detailed help.

Rendered body type: text/plain

Todays half baked idea from WA4DSY:

Perhaps porting APRS to Java might make more sense
than porting to OS/2. The next version of OS/2, code named
Merlin, will have Java built into the OS.
See http://www.austin.ibm.com/pspinfo/os2.html for details.

Java programs and applets will run as if they are native OS/2 code.
Once ported to Java, aprs will run on any Java enabled
platform, which should include just about all of them
within a year or so!

Java enabled aprs web servers could be built which
would allow anyone with internet access and a Java
enabled web browser to see aprs data. Said web servers
could also exist on the tcpip/ax25 radio links (at 9600 bps and higher).

Dale Heatherington, WA4DSY

A word of advise that saved me a lot of trouble .... Video cards that use the "S-3" chip set (many new ones do) will cause address conflicts with com4. This will NOT show up as a conflict in device manager because device manager looks at the first address of the range only. The S-3 chip set uses a couple of addresses in the middle of the com4 range. In summary, if you have an S-3 chip set, com 4 is out of the question.

I found out my motherboard took
>control of which interupt the video card had. Then it and Win95 proceeded to

>hear some feedback from those that actually used the DFjr rather then

I have had really great results with my DFjr. To evaluate the unit I wired the DFjr and a GPS to a laptop. I then stored the coordinates of a couple of repeaters as waypoints in my Garmin 45. To evaluate the performance I wrote a short program that parses the NEMA messages to get the cars heading as well as the GPS bearing to waypoint. I then use this data to correct the DFjrs "relative" bearing (to car) to an actual bearing. I then compare this to the actual and display the results on the screen and save to a file for later analysis. I use a SPDT switch to toggle between NEMA and DF and throw the switch when I have a clear tone from the doppler.

This method is also the BEST way to calibrate the DFjr since you can do this while moving (doppler's work best when in motion).

The results were very good with errors ranging in the +- 5 degrees typical in the clear. There were some wild readings when in areas of high reflection (this is unavoidable with a doppler cause it will lock on the strongest signal which may be a reflection) but when used in motion the unit performed well. I just won a local fox hunt last Sunday (only two teams but doppler worked VERY well).

I will try to gather some numbers from my setup and post them here (maybe next weekend) Overall I am VERY pleased with Agrelo - I had one of the first units that had problems with grounding. Agrelo was quick to determine the problem and promptly shipped the fix (are you listening Bill Gates :))

As far as using the DFjr with APRS - The Dayton release of DOS APRS did not support the DFjr with the GPS interface. The latest release also seems to have problems if you want DF and GPS data coming in on the same port. I tried configuring APRS to use port 1 for both DFjr and GPS and NO TNC but it wouldn't work unless I had a TNC selected and used SPM which resulted in "buffer overflow errors"

My only portable computer is an HP200 palmtop BUT my foxhunting partner just bought a P90 laptop :) :) so maybe I can give you an update on using the DFjr with WinAPRS soon.

Oops! While it is true that the speed of light IN FREE SPACE is a constant, light travels more slowly in any other medium and the velocity varies for different materials. It also becomes frequency-dependent when the medium is not free space (such as the earth's atmosphere). So the wave fronts produced by a point source can easily be nonspherical. It is sufficient simply to have two or more different materials within the volume being considered.

Then there are birefringent materials in which the velocity of light varies with the direction of propagation (they are not isotropic). This produces nonspherical waves from a point source even when the entire space under consideration is homogeneous.

In the case of GPS signals, the atmosphere is a constantly-changing material

with a varying speed for EM waves. The wave fronts will never be truly
spherical.

Bob:

How do I configure APRS to look for GPS and DF data on the same serial port???

For now I will NOT have a TNC hooked up. Here is my setup.

```
    --------
   |  GPS   | ------------
    --------              | NC
                         ---  MOMENTARY SPDT          ---------
                           --o---------------------- | Laptop  |
                         ---                          ---------
    --------              | NO
   |  DFjr  | ------------
    --------
```

I prefer this over using the GPS input to the DFjr since it allows me to
determine when to take a bearing. Also I feel the cars current heading
needs to be reported at a higher rate than the DF info (especially on curvey
roads).

I tried several different settings in APRS but could ONLY get this to work
if I selected a TNC on PORT 1 and then selected PORT 1 for DFjr - But with
the above setup the continuos GPS data was overflowing the buffers.

Any help would be appreciated!

Thanks and 73,

Steve Hall - KK4PM

I use a couple of these cards under OS/2 and they work beautifully. I want
to add them to my WinAPRS machine (Win95), but have been hesitating for
obvious reasons.

I am using IRQ 2/9 for my bus mouse and com1/2 for WinAPRS. What would you use for the 4 additional IRQ settings on this board? I can figure out addresses, but am not familiar with how finicky Win95 is going to be with interrupts. With OS/2 it is a piece of cake, but I am not nearly so confident of what I have seen so far with Win95.

Hi Bill,

Sorry that your question wasn't answered accordingly, we weren't ignoring you, we simply must have missed it.

The DFjr's are shipping as scheduled, 6 weeks delivery from order date. Your's is shipping on 6/21/96. We have had many good reports on the DFjr's performance, unfortunatly, no one post these to the SIG, only to me personally. I have asked on several occasions for people to post their experiences with the DFjr with no response, with the exception of the bad reports of coarse, hi.

Anyone that has a question, should either e-mail or call Eric or myself and we will be more than happy to answer your questions.

I just purchased a fully automatic SMD assembly line including a solder screen printer, pick-n-place machine, and 8 zone reflow oven, to help keep up with our orders. Our intension is to have DFjr's available off the shelf for same day shipping in about a month.

I sincerely hope this helps answer some of your questions.

I just posted a message to Bill KE4EER/APRSSIG regaring the shipment
of his DFjr, we are on schedule and his unit will be shipped on
6/21/96. Our deliver time is approx. 6 weeks from order date as stated
during the placement of the order.

Here is a clip of my original message.

This is called a terminal server.  I have an older 3com CS210 (ethernet
to 16 port RS232) that I plan on using with my Sun workstation as soon as
the Sproul brothers release XAprs...If you scrounge around some of the
older terminal servers like this one can be found.

> Great Steve and thanks for the information, and i hope you will keep us informed as to the progress of your tests. I wonder what version of APRS you where talking about since Bob did do some fixing in 76d. Mine is suppse to be shipped the 21st of this month so hopefully i will also post some feedback to the sig since it will be a big part of APRS. Thanks again Steve. I used this bandwidth by posting the whole message and the reply because i'm sure many users are intersted in this.

599. MAR-6 purchase.

From: Bernard Seront <seront@seism1.ess.sunysb.edu>
Date: Sun, 16 Jun 1996 23:52:54 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960617035254.006fe614@seism1.ess.sunysb.edu>
Rendered body type: text/plain

I got a few people interested in the MAR-6 (if you missed it look at message 1946 and the following thread).
We need a couple more to reach the 50 units, so I can order. If you are interested, please answer before tomorrow (Tuesday) night, and i'll work on that Wednesday.

Regarding the noise figure parameter, I overlooked the importance of it. I don't know either what the noise figure of a typical handheld GPS is, but a 3dB noise figure for the preamp looks just right for me. If someone has exact numbers about the rcvr noise figure for handhelds, or what amp ship is used in commercial active antennas, let us know.
Don't forget that the purpose of this pre-amp is to get better results with an external antenna (typically the QST patch) and the usual handheld (or GPS20) we are using in a car. If this can be done with a 2$ MMIC and a couple of extra parts, that would be great.

What I know is that a couple of people claimed good results with the MAR-1 amp (limited to 1GHz!, NF is 5.5 dB)and the MAR-3 (2 GHz and 6dB NF, but 5V power supply, I don't know how to get that from a handheld with the required bias resistor), and that the MAR-6 is definitively better than that.

Problem here seems to be the 5 V power supply, there is not that much low noise amps that can work with 5V or less. Actually, I don't know of any other one.
If you can supply 15V @ 70 mA, then there are alternatives from Mini-Circuit with 1.5 dB NF, but I bet it's not going to be the same price.

One detail about the MAR-6: standard case and SMT are actually the same size and shape: cylindrical 0.008"diameter with four leads going out of the side at right angle. Difference is that the std has .256" straight leads, SMT has bent and somehow shorter leads. SMT may be easier to work with (easier to solder on a stripline).

```
          __           __
         |  |         |  |
     ----|__|----   _/|__|\_

          std          SMT
```

As I said, I don't know how well the MAR-6 is going to work for GPS, but how can we really decide without trying?

Bernard, KB2TGH.

Do you have any idea how the box determines the distance? Is it only based
on the amplitude of the pulse? Any idea of the frequencies detected, or is
there any bandpass filter?

>I would very much like to be able to direct connect this into a computer or
>tnc.  Using the basic stamp is neat, but adds alot to the cost.
>

As for the stamp: yes it's kinda expensive, especially for "production".
One answer is to use a PIC 16c84 instead. It has 1 K word of program memory
in EEPROM. A minimal programmer can be built for less than 10$, a serious
programmer in kit is ~40$. All the software tools: compilers, programmers
app and the docs are free on the web (besides that's the same for the
stamps, everything is available free on the web). A pic16c84 10 MHz is 10$.
There is a third party basic compiler available for 99.$
Last news is that parallax itself just came out with a compiler, that let
you burn your Pbasic program directly in a 16C58. You do need their 109$
programmer for that, as I understand.

>Can any of you programmers come up with a way to count pulses on a rs232
>port..?  Can a conputer tell the diff  in amplitude or will I need a box to
>convert this..?  Also, code needed to quantify the pulses to indicate that
>they are getting closer..
>

You can detect CTS, usually used by the computer to know if the terminal is
ready. That can be done with parallel port too: there are a couple of input
lines so the printer can indicates it's busy. No way to determine the
amplitude though.

Steve,

If you use the Multi-Port Adapter (MPA) you can set everything as follows,
and use the force DF bearing update feature, this overides all port settings-

1)Turn DF port off.
2)Turn GPS port on.
3)Set desired POSIT rate for GPS.
4)When you like the bearing, press MENU then ENTER.

When step 4 is executed, the DFjr will send a GPS POSIT then
the bearing and quality factor i.e.

```
$GPRMC,194616,A,4306.37,N,07448.67,W,000.0,360.0,010396,013.9,W*73
%279/8
```

The ATI Mach 64 readme file memtions this. But it was on the driver
disk along with a lot of other stuff I didn't think was important.
After about a gazillion hours I read the documentation. Ergo no com4.

What I wound up with was com 1 - all my radio stuff on a switcher, com2
- the mouse, com3 - fax/modem.   It is not easy getting your mouse on
com2 either in win95. You have to disconnect everything else and let
win95 look for it on com2. then you can insert your fax card and hook
up your other stuff.

Hope you had better luck.

Subject: [APRSSIG:2012] USGS FILES

Question, are the 100k opt data files on USGS still usable since they
changed format a while back?. If so they need to be unblocked, they
recommend CHOP.ZIP but i haven't been able to make that work for some
reason (Probably giving it the wrong command). I know UNBLOCK.BAS is
listed on tapr but tapr seams to be down and i haven't been able to
access it for a while again.

Good point! I now understand that the Almanac is updated to reflect on
changes of atmospheric conditions that may affect the speed of propagation
of lights or EM.

How is that done? Wouldn't they have to have monitoring stations all over
the place to measure the propagation delay, and update the Almanac?

Also, Einstein says GRAVITY has something to do with the propagation. I
wonder if the gravity of the Moon has any adverse effect on it?

Bernard, KB2TGH, writes:

>I was looking for a pre-amp chip for my home made GPS antenna for a while,
>and found something interesting:
>
>The MAR-6 from Mini-Circuits is the perfect candidate for that.

Yes it is. I've worked with the MAR series for five years and have to agree.

Bernard has the schematic right. While the application notes call for a choke on the power lead this is one of the situations that is an exception (i.e., a choke doesn't accomplish anything!). The capacitor values are noncritical; they're just there for decoupling. I usually use 10pF.

A few tips for somebody inclined to fool with this:

1) Depending on the GPS, you might need to fool with the resistor value. The GPS itself may have already assumed a certain amount of current limiting and it is too easy to limit them below their operating threshold.

2) The operating threshold *is* important. MAR's (and other MMIC's) become noise generators if undersupplied.

3) Construction is critical with the MAR-6's. They have a lot of gain (20dB nominal, probably 15dB at 1500 MHz), and even though the device itself is inherently stable, sloppy construction can result in a feedback loop and then you've got yourself a broadband oscillator. Aside from stripline style, I strongly recommend that the entire amplifier be constructed in SMD.

4) I'd find a way to put the MMIC in the antenna itself, which is how the store-bought antennas are constructed. Doing the preamp as a separate box just multiplies the potential problem points.

I've been following the discussion about the integration of the MIC-E into "normal" FM repeater operation, and have a couple of comments.

As seems to be S.O.P. for some of the technical tricks around here, the MIC-E assumes perfect operation and full-quieting signals. That's not real world. I take it

Would cover Linux, too :-)

Linux has support for Java binaries, starting (in stable form) in 2.0.
However, you have to install the Java Development Kit.  I haven't looked
much into it, but...

The major problem with Java would probably be the "unprivledged" nature of
Java.  I'm assuming that Java blocks access to the com ports, et al, since
it could be used for malicious purposes.  So, it would probably not float.

However, it would be nice to have a modular approach.  Have a main "backend"
that is extremely portable between OS's and just does the grungy operations,
and then write OS-specific things on top of it that the backend hooks to.
It would make code maintenance a *LOT* easier.  I'm assuming that Mark/Keith
are already using it for WinAPRS/MacAPRS in some form, since they're pretty
much the same.  -rt

Oh - I left some crucial information out of my posting about MAR-6's!

It is not necessary to go through all the trouble of a group purchase for MAR-6's, as there are at least two retailers who will sell them to individuals on a one-each basis. I do, however, recommend that you always buy four or five if it's your first exposure to MMIC's - you need ample spares to sacrifice to the soldering-iron gods!

MAR-6's may be purchased from:

Down-East Microwave (I forget their number; check the ham magazines).

Gateway Electronics, 1-800-669-5810.

Down-East sells 'em for $2 each if memory serves right, Gateway around $1.50 or so.

613. MIC-E & Voice Repeaters

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 17 Jun 96 13:31:40 EDT
To: <aprssig@tapr.org>
Rendered body type: text/plain

Message-ID: <960617173139_71301.3106_FHJ77-4@CompuServe.COM>

As an owner and/or maintenance and/or control op on a number of repeaters, I've been following the MIC-E developments with interest.

My experience with packet and FM repeaters begs the question: will users willingly put-up with MIC-E operators who have less than perfect signals? I know that *I* wouldn't!

IOW, I think it's a really bad idea to rely on DCD to mute the repeater. The threshold for detection of valid data on most TNC's requires a signal that is practically full-quieting. That's not real-world.

There needs to be more work done on the MIC-E/voice repeater piggyback concept before it's ready for "prime time". I have three suggestions for development paths:

1) 9600 baud. The brief data burst would just sound like a long squelch tail. [Disadvantage - major implementation challenge on all but a handful of transceivers.]

2) A separate purpose-built DSP module instead of using DCD for detection of data content. It's not important that the data be decoded for muting purposes, just that the presence of data tones is recognized. DSP would reliably pull the tones out of the hash.

3) Separate transceiver for MIC-E. IOW, a "data channel", something we've already developed. If there was a big push here to implement MIC-E quickly, that's how I'd do it.

You'll notice that on #3 I said "transceiver", and that includes a full TNC with a means to hold transmit if the channel is busy. I'm not happy with the suggestions I've seen about blind transmitters; this is very poor Amateur practice and would earn an Official Observer notification if I caught it in use.

There are a lot of great ideas circulating in the SIG, but we need to be much more mindful of how things are going to work when operating conditions (or operators!) are less than optimum. We're not the only ones on the bands.

...mike musick/N0QBF

[PS - apologies if a bogus message with the same header appears on the sig. My e-mail program has indigestion and claims that it's going to send a poorly-worded message that was deleted from the queue. Oops.]

WHO NEEDS A CLOCK?

Question: Wonder why the clock in the GPS receiver isn't dispense with all together?

Since we know the locations of the satellites; and we know they are broadcasting UTC time super-accurately, why not use the LORAN theory. The RATIO of the time difference (of arrival of the signals) from two satellites should give us a good hyperbola. And a third satellite will solve the ambiguity.

WHY NOT? Is there any reason why not have LORAN in the sky?

Furthermore, since only the RATIO is used, then we won't have to worry about birefrigence; double refraction; or any atmospheric condition that would adversely affect the speed of propagation of electro-magnetic waves. Si?

615. Re: MAR-6 and QST patch ant

From: "Baker, Donn B   RV" <dbb4@PO7.RV.unisys.com>
Date: Mon, 17 Jun 96 13:32:00 CDT
To: aprssig <aprssig@tapr.org>
Message-ID: <31C5A453@rsvl_gw.rsvl.unisys.com>
Rendered body type: text/plain

I have used a MAR-6 with the QST patch antenna, and the amplifier does improve the reception somewhat. Even with the amplifier, it is not as good as the Trimble patch... but it is a LOT cheaper. I have both; the Trimble is more or less permanently mounted on the back of my mini-van, but I still keep the QST patch and MAR-6 handy.

The MAR-6 is SPEC'd at 3 (or 3.2) dB noise figure... but by the time you get it onto a substrate, with connector, input capacator, solder, etc., you're actually around 4 or 4.5 dB. This is NOT that bad. It's not good, but it's not that bad. (A word of caution... You really do need to isolate the antenna from the device: the input pin is DC coupled to the circuit. If you should accidently ground the plate of the patch antenna, the device will no longer work, and it is possible that it will self-destruct ! The input C should be maybe 20 to 50pf, and it SHOULD be a chip type. A disk ceramic or silver mica will work, but these will also increase the NF.)

There are some other devices, such as the HP 86576, GaAsFET MMICs that are specifically made for this market place. They are somewhat more expensive (DownEast Microwave carries them for $12 ea), and are spec'd at ~ 2dB NF. BUT, they are NOT unconditionally stable if the substrate is more than 0.040" thick. I don't think they are worth the extra hassel for not that much better a NF. If they ran 1 dB, well....

Bernard, I'd strongly recommend that you go with the standard packages, and NOT the surface mount ones. The SM packages are much more difficult to solder unless you have exactly the correct soldering iron, tools, etc. With the standard packages, you can drill a "tight-fit" hole, say, 0.082" (I *think* thats a #43 drill... don't know, as I'm at work, and don't have a drill table here), and drop the pill into it and then solder. Also, this places NO stress on the leads. They DO break.

Alright, since someone mentioned it, I will admit it, this is exactly my plan. Check out

<http://www.bridge.net/~sdimse/javAPRS.html>

There are a few problems with running a full-blown version of APRS this way, mostly speed. For now, Java is an interpreted language, so things run slowly. Eventually the Java interpreters will support "just in time" compilation, which will improve things. I do not intend to produce a fully functional version of APRS that competes with dos/win/MacAPRS, rather a set of applets designed for specific needs.

So far, my program displays dosAPRS maps, and can plot positions. It also can read a stream of incoming GPS data and parse out the position data. I've only had the development environment for a couple of weeks, so javAPRS is still in its infancy. Stay tuned for further details...

If you're gonna go to the effort to build a preamp for your GPS
antenna, please avoid multiple problems (or complete loss of utility)

down the road and fit a good bandpass filter in front of the amp. Those little amps are very wide band, and your 2m or 440 or HF rig in the vehicle with you is gonna swamp the darned thing every time. I face this right now with my amp'd Garmin antenna and others know exactly what I'm speaking of...

Bernard, KB2TGH, writes:

>I was looking for a pre-amp chip for my home made GPS antenna for a while,
>and found something interesting:
>
>The MAR-6 from Mini-Circuits is the perfect candidate for that.

Yes it is. I've worked with the MAR series for five years and have to agree.

Bernard has the schematic right. While the application notes call for a choke on the power lead this is one of the situations that is an exception (i.e., a choke doesn't accomplish anything!). The capacitor values are noncritical; they're just there for decoupling. I usually use 10pF.

A few tips for somebody inclined to fool with this:

1) Depending on the GPS, you might need to fool with the resistor value. The GPS itself may have already assumed a certain amount of current limiting and it is too easy to limit them below their operating threshold.

2) The operating threshold *is* important. MAR's (and other MMIC's) become noise generators if undersupplied.

3) Construction is critical with the MAR-6's. They have a lot of gain (20dB nominal, probably 15dB at 1500 MHz), and even though the device itself is inherently stable, sloppy construction can result in a feedback loop and then you've got yourself a broadband oscillator. Aside from stripline style, I strongly recommend that the entire amplifier be constructed in SMD.

4) I'd find a way to put the MMIC in the antenna itself, which is how the store-bought antennas are constructed. Doing the preamp as a separate box just multiplies the potential problem points.

> Question: Wonder why the clock in the GPS receiver isn't dispense with all
> together?

Because all a GPS receiver really is, is a very accurate clock (short term)
that can be sync'd with the GPS time for timing recovery.

> Since we know the locations of the satellites; and we know they are
> broadcasting UTC time super-accurately, why not use the LORAN theory. The
> RATIO of the time difference (of arrival of the signals) from two satellites
> should give us a good hyperbola. And a third satellite will solve the
> ambiguity.

Wrong, and wrong.  We have an idea from the broadcast ephemeris where the
satellites are, within 20 or so meters.  That's not precise.  We are concerned
with which integer wavelength of the GPS signal (OK, really which chip from
the SS signal, but for our purposes it's the same) we are receiving.  Not just
getting atime hack.  And finally, the GPS NAV timing signal is broadcast in Z
code, which is based in seconds since start of week.  You then have to do
significant table lookups and logic trails to make sure you know how many leap
seconds, and when, to add 'em in.

> WHY NOT? Is there any reason why not have LORAN in the sky?

Wavelength is too long?  LORAN is reasonably precise for local areas without
LF/MF multipath and fading, say, within 100 km of the chain.  LORAN in the sky
might just improve that somewhat, but maintaining the absolute and timing
relationships of the stations (satellites would be interesting.

> Furthermore, since only the RATIO is used, then we won't have to worry about
> birefrigence; double refraction; or any atmospheric condition that would
> adversely affect the speed of propagation of electro-magnetic waves. Si?

Nope.  The RATIO is nice, but absolute differences are used after the integer
ambiguity is resolved, either by measurement, algorithm or guess.

Propagation remains a real issue.

I went the comp.lang.java news group and found the following thread
about serial ports and Java.  Platform specfic code will be needed
if a TNC needs to be accessed with the serial port.  It could be a
DLL or a small program which acts as a gateway between some
tcpip socket and the serial port.  For those who access
aprs position data only from internet won't need serial
port access.

Yes, this method will work perfectly. Portability is not a problem
since a serial port is NOT a portable device.

But how to transform this java application into an applet application?
A problem arises : an applet cannot use native functions to access
specific CLIENT-side device such as its serial port !

Is anybody aware of that?

>it could be used for malicious purposes.  So, it would probably not float.

Java doesn't block access to anything AFAIK; the blocking is the
responsiblity of the container application (web browser, etc.)  I'm
not sure about the serial ports, but most Java containers I'm aware
of, like Netscape 2.0, certainly do block file I/O to one degree or
another, as well as spawning external processes, connecting to other
machines, etc.  With Netscape 2.0, for example, not only is writing
to a file prohibited, the poor Java applet can't even *read* a file!
Another problem is that excellent reverse-engineering tools are
available from Sun, so everybody can simply and easily open your code
up and look at its internals.  Another problem is speed - Java is
quite slow for "serious" work; I'm not sure if this would really be a
problem with APRS, though, since we seem to do OK with 6 MHz 8088s.

Well guys it looks like i will be doing some Agrelo DFjr testing very soon now since mine will be shipped on the 21st of this month. Joe Agrelo has been very helpfull. I have been in contact with Joe and he assured me that in fact they are shipping daily but with as many orders as they are getting things tend to bottle neck here and their as it would with any new product . I suggested that he update his web page so as to keep people informed as to what is happening with the DFjr. Personally i can't wait to give it a try, i'm hoping it will work ok with the latest version of APRS because i'm planning to use it with my TNC,GPS,DFjr and APRS on my laptop. Of course i will keep the sig informed as to my tests hi. Let Joe know if you need information about the DFjr or any of it's aspects (I did and he has settled my nerves hi).

Isn't the shoke a low pass filter?
In the GPS application the bias resistor fold back to the antenna coax, ie the resistor is in parallel with the blocking cap, we may want to avoid high frequency signal to find a path trough this resistor?

If the gain versus frequency is linear as suggested in the data sheet, that gives 13.5 dB at 1.5 GHz. I first thought of limiting it by limiting the power supply current (bias resistor larger than required), as we may need only 8-10 dB, and this is good for the batteries (if used). Maybe not such a good idea because of the operating treshold?

Yes construction is quite critical, but as the amp is made of a MAR-6, two caps, and a resistor (+ shoke?), the PCB is quite straightforward. One needs to be precise with the width of the strip line though. The design in 73' (Dec 92) looks fine. I'll make and upload (on the ftp server) a drawing.
SMT version of the MAR-6 is the same as standard one, the leads are just pre-bent to shape. Capa NEED to be SMT ship. For the resistor I don't think it matters(?).

>4) I'd find a way to put the MMIC in the antenna itself, which is how the
>store-bought antennas are constructed. Doing the preamp as a separate box just

>

My idea is to build the amp directly on the ground plane of the QST patch antenna. One replaces the aluminum ground plane by a PC board and etch (or just grind) the striplines right on that.

If there is another and easier way than direct purchase that's perfect.
But as a dozen people already answer me and I have enough interest to buy 50
of them I'm going to do it anyway (unless everybody drop me an e-mail saying
no I don't want them anymore :-).
My interest in that is to have more than one guy trying it in various
configurations so we may have an improvement of the QST patch antenna.
It may also be just what is needed with a remote garmin 45 helix to overcome
coax loss.

So if you want one or a couple of MAR-6, let me know before Tuesday night, i
can order more than 50

Jon, NW6H, opined:

<<[preamp...overload...] I face this right now with my amp'd Garmin antenna and others know exactly what I'm speaking of...>>

One of the funny things about life is that we hear about problems with Situation X, but then rarely hear from those who *don't* have the problem.

I have the Garmin amplified "black mouse" adapted for permanent mount, and run five bands (6m thru 1.2GHz, skipping 900). I've paid a lot of attention to a clean mobile installation, and have never noticed a problem with the GPS losing lock as would be inferred by what you describe. On the other hand, I listen a lot more than talk, which could also be a factor. I don't know your (or the others') particular situation; I will, however, suggest that reliance on mag-mounts is asking for RF in places you don't want it.

Anyway, adding bandpass is a sound idea, but the extra effort entailed should not be requisite to experimentation with the concept. If my plate wasn't already full I'd take the extra moment or so to whip-up some PC artwork with a stripline filter fore and aft of the amplifier for good measure, but that'll have to wait for another day.

Date: Mon, 17 Jun 1996 18:25:14 -0000
To: aprssig@tapr.org
Message-ID: <199606172225.RAA06242@tapr.org>
Rendered body type: text/plain

On 17 Jun 96 at 13:43, Mike Musick wrote:

> As an owner and/or maintenance and/or control op on a number of repeaters, I've been following the MIC-E developments with interest.

Me too.

> My experience with packet and FM repeaters begs the question: will users willingly put-up with MIC-E operators who have less than perfect signals? I know that *I* wouldn't!

Do you or your users now "put up with" folks who's signals are less than perfect? From what I have seen at Dayton, the burst from a MIC-E is very short.. Shorter than your average packet because the TXD is gone.

> IOW, I think it's a really bad idea to rely on DCD to mute the repeater. The threshold for detection of valid data on most TNC's requires a signal that is practically full-quieting. That's not real-world.

Wonder if you have heard the signal from a MIC-E module. The burst is not as offensive as 1/2 of the "courtesy" tones I hear on Repeaters already. PLUS my TNC's regularly decode signals in the range of strength in the "comfort zone". I don't plan on muting the Signal at all to start.. This will get people asking questions on what the Burst is.

> There needs to be more work done on the MIC-E/voice repeater piggyback concept before it's ready for "prime time". I have three suggestions for development paths:
>
> 1) 9600 baud. The brief data burst would just sound like a long squelch tail. [Disadvantage - major implementation challenge on all but a handful of transceivers.]

Plus, the Signal quality needs to be better than at 1200Baud. The comfort zone will have to be the easy-chair zone.

> 2) A separate purpose-built DSP module instead of using DCD for detection of data content. It's not important that the data be decoded for muting purposes, just that the presence of data tones is recognized. DSP would reliably pull the tones out of the hash.
>

I think the hash won't be as bad as you think.

> 3) Separate transceiver for MIC-E. IOW, a "data channel", something
> we've already developed. If there was a big push here to implement
> MIC-E quickly, that's how I'd do it.

Isn't a seprate Data Channel the same as a stand alone tracker on
145.790 Mhz??

> You'll notice that on #3 I said "transceiver", and that includes a
> full TNC with a means to hold transmit if the channel is busy. I'm

> this is very poor Amateur practice and would earn an Official
> Observer notification if I caught it in use.

The MIC-E is NOT blind.. It has simple busy channel monitoring
capabilities that would work wonderfully on a Voice Channel.

That's an excellent idea. I first thought the SMT would be easier to solder
because you don't even have to bend the leads, but the hole for the MAR body
makes me change my mind. Will simplify the layout too: you just need to
insulate a stripline on the ground plane.

I know that this is an APRS SIG, however we are all hams and part of the
anachronism is packet... at any rate i am getting a GPF when I try to load
WinPac. It tell me that packet is causing a GPF in module WPSCR.DRV. I have
re loaded it , wiped it out started from scratch and no luck, so I am
turning my friends on this SIG. I hope that someone can help, it is a great
program, when I can get it to run...

In advance, Thanks & 73.....Alan, WC7R

633. Encoded messages

From: Pat Bunsold <pbunsol@cati.csufresno.edu>
Date: Mon, 17 Jun 1996 16:10:37 -0700
To: aprssig@tapr.org
Cc: tuck@pacbell.net
Message-ID: <199606172310.QAA10156@CATI.CSUFresno.EDU>
Rendered body type: text/plain

Once again, I plead to the SIG NOT to send these long long attached encoded
files! Last time I was flamed into oblivion by the 1 or 2 people who actually
wanted these files. Attached files to E-Mail , especially long ones like that
GRAN.EXE are only good to those who can decode them. I do not have any way
to do this as I have an E-Mail only account that offers no extras. Also, I
have to download all the messages at once with no pickychoosy of ones I prefer

not to read. Its all or none! Luckily I didn't print it out! Where do people
get the decoders for these strange files?? I have no FTP services so I can't
download it unless it is on a local BBS. Downloading 165 messages today ran
up close to a Megabyte of text because of that GRAN.EXE file! So, save your
Flamethrowers, just don't waste my and most everyone elses disk space with
un-decodeable files. Put them in the TAPR FTP section or on a BBS, but PLEASE
NO MORE ATTACHED E-MAIL FILES! Thank You
Pat Bunsold WA6MHZ
PS The rest of the SIG data is great and is extremely helpful for APRS addicts
like myself! Keep sending out those hints and kinks!

Has it been that long already?
This one seems to come up 'bout every 6 months.

Please do not move this SIG to a news group!  The SPAM there is horrible,
and many folks do not have news group access (as Joe D  says).  More and
more people are at least getting email service, which is all we need for this.

Plus, now if I REALLY want to overload things, I can forward my Email
address to the one that my Alpha pager has. Then I could be paged with every
SIG message as it is posted.  Wouldn't that make me productive at work!
Ralph's beeper: BEEP  BEEP BEEP .
Ralph's Boss:  What was that?
Ralph:     Nothing, just the latest word on Satellite GPS clocks, Cruise
Missles, HSP questions, or Mac vs PC vs whatever.    hehe

Can't do that with a Usenet Group.

And the best plus of all, some mail readers now have filters that allow you
to automatically redirect messages that meet certain criteria (like this
one) right into a special mailbox (APRSSIG for me)  or to the *trash* (for
certain people).  My mail is easy to read, with everything sorted into its
own little place.  Only thing that is in the "in" box is are the personal
messages.

> While I enjoy the on going discussions on the APRS SIG,
> it might be time for moving the SIG to a USENET news group.

I think we covered this once before.  I for one am extremely against
this.  In the case of email it is active, I just sit and the mail comes
to me when I check.  With a newsgroup it is passive, I have to do the
work of checking and is less friendly with checking from remote locations
via dumb terminals (although not impossible).

> My mail box fills quickly with the numerous postings.

As far as I know there is no limit on how much mail you can recieve.
With several hundred (~700) messages in my mailbox it was still less then
a Meg, my web stuff is ~1.5MB, I am allowed around 8, so that leaves me
room for ~4500 messages (on average).  Since I generally get 100-150 per
day (lets say 200 for conservativism like any good nuke), 4500 / 200 ~
22.  I could go 22 days without reading my mail ... might make for a long
time to read, but it would be better then coming to find out the news
server only carried 14 days worth ...
```

```
Lets lay this baby to rest, if you would like an APRS newsgroup feel free
to start one, in the meantime I would prefer to have Bob/Mark/Keith (not
to mention Joe A.) stay right here and continue to amaze me with their
wit and wisdom!

Message-ID: <19960617.223545.13727.3.W4WWQ@juno.com>
Rendered body type: text/plain

```
I also DISAGREE with the move to a USENET.

 I don't have access to the news groups and the rest of Internet, but I
do have FREE e-mail access to the world via JUNO.COM.

If anyone is interested in FREE e-mail, with 1-800 access also FREE, look
at :

              http://www.juno.com

I don't have their 1-800 # for free software, but understand it is on
their WEB page.
Or you can send a message to "signup@juno.com",  subject: "Give Juno To A
Friend" and in the text enter the name and (snail) mail address where to
send the software.
```

```
As far as the quanity and quality of the APRSSIG messages, I find the
delete key works very well.  I put faith in the SUBJECT line being
correct.  If it doesn't interest me it probably won't get read.

Pete W4WWQ

Just a follow-up on the posting about 2 meter and 440 rigs swamping the GPS
receivers...I spoke with Garmin and their recommendation is to simply move the
GPS antenna to provide a better degree of separation!

I was having this same problem and moved the antenna SIX INCHES and totally
cured the swamping effect!  I haven't experienced the swamp effect using teh
Blackjack antenna and won't say that swamping is not a problem with it.

I WOULD appreciate any/all reports from users of the Blackjack on any swamping
that occurs in using this antenna!  I am very serious about making the Blackjack
a very reliable unit and want to include as much operational information and
tips in the documents that we send out with each unit!

Thanks for the input!!!  Please reply via PRIVATE MAIL...

Rendered body type: text/plain

Forwarding note from: aprssig@tapr.org Thu, 13 Jun 1996 17:25:51 -0500 (CDT)

I have been able to convince Davis Instruments to release their Programmer's Reference Disk at NO CHARGE. The information is available either from their LLBBS (510- 293-3546) or their internet address (http://www.davisnet.com

Davis is now committed to Amateur radio, and is proving it by this FREE OFFER. There is only VERY LIMITED personal support, since they are offering it FREE, so do not expect to get unlimited phone support from them.

I hope that this is helpful to anyone who wants to "tinker" with interfaces. I have been able to put together a complete comparison of the Davis Weather system and the Peet Brothers Ultimeter system. I will try and get it out to the SIG over the weekend, so that an informed decision can be reached, if you are considering the purchase of a weather system.

Hope to see all of you "On the Map".

Very slick Steve,

I haven't had time to learn JAVA yet, but I would love to eventualy add something like this to our web site, using the DFjr of coarse, this way people could actualy see what the DFjr/GPS/APRS is capable of before making a purchase.

Keep up the good work!
